ROM Release 1B88B -- December 1983

(c) Copyright Hewlett-Packard Company 1983

**** NOTICE ****

Hewlett-Packard Company makes no express or implied warranty with regard to the documentation and program material offered or to the fitness of such material for any particular purpose. The documentation and program material is made available solely on an "as is" basis, and the entire risk as to its quality and performance is with the user. Should the documentation and program material prove defective, the user (and not Hewlett-Packard Company or any other party) shall bear the entire cost of all necessary correction and all incidental or consequential damages. Hewlett-Packard Company shall not be liable for any incidental or consequential damages in connection with or arising out of the furnishing, use, or performance of the documentation and program material.

Table of Contents

- 1 INTRODUCTION
- 2 LIST OF MODULES IN ADDRESS ORDER
- 3 LIST OF MODULES SORTED BY MODULE NAME
- 4 LOAD MAP FOR ROM RELEASE 18888
 - Includes:
 - Module Summary
 - Cross Reference
 - Hex Dump Of Code
- 5 SOURCE MODULES IN ADDRESS ORDER

INTRODUCTION

CHAPTER 1

This volume contains the complete source code listings for the HP-71 Operating System. The modules are presented in address order according to their position in the operating system, from lowest address to highest address. The following sections give a list of the module names in address order, followed by an alphabetical list of the module names. A module's source file is denoted with an ampersand (&) in the file name, and its relocatable (binary) file with a percent sign (%) in the file name.

Interface information to an entry point or poll is described in a documentation header in the source file that contains that entry point or poll. Supported interfaces are identified by the "Name: (S)" line of the documentation header, as described in Volume II of this document.

It is the intent of HP to preserve the supported interfaces described in this document, as well as the absolute address position of each supported entry point, through any future updates of the HP-71 operating system. In general this allows external software which uses these interfaces to work predictably without regard to the version of the HP-71 on which it is run. However, HP reserves the right to adjust the supported interfaces in any manner it chooses.

An unsupported entry point may be added to the supported list if HP deems the request to be justified. To request support for an entry point, please contact Systems Engineering Support in the HP Portable Computer Division Product Support Group at (503) 757-2000. Corrections or requested enhancements to the interface documentation are welcome and should also be reported in this manner.

WARNING !!

Only supported entry points are available for use by external software. HP expresses no intent to indefinitely preserve the interfaces to any unsupported entry points described in this volume or in Volume II, since it is inevitable that code in any 64K byte operating system will have to change or move occasionally to fix bugs. The interface to unsupported entry points, and their absolute address position, may therefore change at any time and without notice to outside parties.

LIST OF MODULES IN ADDRESS ORDER

CHAPTER 2

Address Range	Module	Title
00000 - 00784	SB%DVR	Main Driver
00785 - 00786	TIXREV	HP-71 Revision Number
00787 - 00C9A	SB%BIT	ASCII Tables (Rounded Letters)
00C9B - 00CF6	SB%FGT	F & G Shift Table
00CF7 - 01130	SB%KEY	Keyboard Driver (14 Column Keyboard)
01131 - 01626	TIXUTL	Command Execution Utilities
01627 - 0188F	SB%CMD	Command Stack Utilities
01890 - 02483	SB%DSP	Display Driver
02484 - 0259F	MB%ROM	HP-71 ROM Test
025A0 - 02C25	JP%PR1	Line Parse Driver - Part 1
02C26 - 033D5	JP%PR2	Parse Routines - Part 2
033D6 - 03FD4	JP%PR3	Parse Routines - Part 3
03FD5 - 048E5	SB%EXP	Expression Parser
048E6 - 04F5D	AB%LEX	Lexical Analyzer
04F5E - 05921	SG%LDC	Line Decompile
05922 - 0624F	SB%EXD	Expression Decompile
06250 - 062B1	TIXFX1	ROM 1 Fix Module
063A0 - 06F2E	SG%SYS	System Commands: DELETE, AUTO, and CAT
06F2F - 07DDB	JP%SYS	System Commands, RUN Loop
07DDC - 08647	JP%EXC	Program Execution Routines
08648 - 09392	SG%EXC	Miscellaneous Execution Routines
09393 - 09B75	TIXERD	Error Message Driver
09B76 - 0A92A	SG%FXQ	File Execution Routines
0A92B - 0AA80	SB%FCN	Function Definitions
0AA81 - 0AA82	JP%ZER	Zero File
0AA83 - 0AA84	TIXREV	HP-71 Revision Number
0AA85 - 0AA8E	TIXFX2	ROM 2 Fix Module
0ABF8 - 0B638	AB%REG	Variable Creation Routines
0B639 - 0C326	AB%FCN	Functions
0C327 - 0D434	JTXMTH	Math Routines - Part 1
0D435 - 0DE2E	SM%MTH	Math Routines - Part 2
0DE2F - 0E9F0	PM%STA	Statistics
0E9F1 - 0EC6D	MN%BP	BEEP Module
0EC6E - 0F177	MN%UTL	Miscellaneous Utilities
0F178 - 0F5D9	AB%EXP	Expression Execution Controller
0F5DA - 0FA46	AB%ASN	Assignment Statement Controller
0FA47 - 0FF5E	SC%TRC	TRACE Module
0FF5F - 10191	JP%MEM	Program Edit
10192 - 11052	MN%CNF	Configuration Module
11053 - 1231A	SC%FIL	File Utility & System Buffer Routines

HP-71 Software IDS - Operating System Source Listings

Address Range	Module	Title
1231B - 12549	JPXPOL	POLL Routine
1254A - 13448	MNZTM	Clock System
13449 - 138B4	PMZFLG	Flags, Traps, and Modes
138B5 - 14C7F	SCZDAT	Store & Retrieve Data - PRINT#/READ#
14C80 - 153A8	MNZED	Character Editor
153A9 - 153AA	JPXZER	Zero File
153AB - 153AC	TIxREV	HP-71 Revision Number
153AC	TIxFX3	ROM 3 Fix Module
1551F - 1632B	ABXCCLC	CALC Mode
1632C - 16671	ABXBLD	CALC Mode Decompiler
16672 - 16AAD	ABXED	CALC Mode Editor
16AAE - 17A32	FHXTFM	TRANSFORM Execution
17A33 - 17BC6	MNZFRP	FREE/CLAIM PORT
17BC7 - 17DBB	SBXRD	READ Statement Execute
17DBC - 18C57	SBXIO	I/O Execution Routines
18C58 - 18D71	MNZLCK	LOCK Module
18D72 - 1A3D3	SCZSUB	SUBprogram And DEF FN
1A3D4 - 1A57B	SBXEXC	Miscellaneous Execution Routines
1A57C - 1AAAO	SCZREN	RENUMBER Module
1AAAI - 1AD6D	SGXKEY	Key Routines
1AD6E - 1AF00	SBXVAL	VAL Function
1AF01 - 1B01E	MNZGSB	External GOSUB Module
1B01F - 1B445	ABXUTL	Miscellaneous Utility Routines
1B446 - 1BAA3	MBXIMG	IMAGE Parse Routines
1BAA4 - 1C3C4	MBXUSG	USING Execution Routines
1C3C5 - 1C4ED	SBXGPH	Graphics Control Routines
1C4EE - 1C878	SGXPOK	POKE, PEEK\$, and ADDR\$
1C879 - 1DBA5	MNZCD	Card Reader Module
1DBA6 - 1DBA7	JPXZER	Zero File
1DBA8 - 1DBA9	TIxREV	HP-71 Revision Number
1DBAA - 1DBFE	TIxFX4	ROM 4 Fix Module
1DCCE - 1DD03	TIxTS	Timestamp File
1DD04 - 1E536	JPXTAB	Lexical Analyzer Tables--ID=01
1E537 - 1F3DF	SBXTAB	Lexical Analyzer Tables--ID=00
1F3E0 - 1FD23	TIxERM	Mainframe Message Table
1FD24 - 1FE73	SBXKCM	Keycode Map
1FE74 - 1FF2D	ABXLXT	Lextype Table
1FF2E - 1FFFF	SCXTAB	File Type Table
2E100 - 2F9E6	SBXRAM	System RAM Declarations
No address	TIxEQU	Equate File

LIST OF MODULES SORTED BY MODULE NAME

CHAPTER 3

Module	Address Range	Title
ABZASN	0F5DA - 0FA46	Assignment Statement Controller
ABZBLD	1632C - 16671	CALC Mode Decompiler
ABZCLC	1551F - 1632B	CALC Mode
ABZED	16672 - 16AAD	CALC Mode Editor
ABZEXP	0F178 - 0F5D9	Expression Execution Controller
ABZFCN	0B639 - 0C326	Functions
ABZLEX	048E6 - 04F5D	Lexical Analyzer
ABZLXT	1FE74 - 1FF2D	Lextype Table
ABZREG	0ABF8 - 0B638	Variable Creation Routines
ABZUTL	1B01F - 1B445	Miscellaneous Utility Routines
FHXTFM	16AAE - 17A32	TRANSFORM Execution
JPXEXC	07DDC - 08647	Program Execution Routines
JPXMEN	0FF5F - 10191	Program Edit
JPXPOL	1231B - 12549	POLL Routine
JPXPR1	025A0 - 02C25	Line Parse Driver - Part 1
JPXPR2	02C26 - 033D5	Parse Routines - Part 2
JPXPR3	033D6 - 03FD4	Parse Routines - Part 3
JPXSYS	06F2F - 07DD8	System Commands, RUN Loop
JPXTAB	1DD04 - 1E536	Lexical Analyzer Tables--ID=01
JPXZER	0AA81 - 0AA82	Zero File
JPXZER	153A9 - 153AA	Zero File
JPXZER	1DBA6 - 1DBA7	Zero File
JTXMTH	0C327 - 0D434	Math Routines - Part 1
MBXIMG	1B446 - 1BAA3	IMAGE Parse Routines
MBXROM	02484 - 0259F	HP-71 ROM Test
MBXUSG	1BAA4 - 1C3C4	USING Execution Routines
MNZBP	0E9F1 - 0EC6D	BEEP Module

17      ** Name:(S) COLDST - Cold starts machine
18      **
19      ** Category: SYSTEM
20      **
21      ** Purpose:
22      **      Initializes all system RAM, IO Buffers, Pointers etc.
23      **
24      ** Entry:
25      **      None
26      **
27      ** Exit:
28      **      Exits to MAINLP
29      **
30      ** Calls: CONF,INITCL,DSPRST,WIPOUT,AUTCLR,BF2DSP,EDITWF,
31      **      I/OALL,FPOLL
32      **
33      ** Uses.....
34      **      Exclusive: Absolutely everything in the entire machine
35      **      except independent RAMs
36      **
37      ** NOTE:
38      **      This routine should be used with caution since it may
39      **      annoy the user.
40      **
41      ** Algorithm:
42      **
43      **      Enables interrupt system
44      **      Initialize CMOS test word
45      **      Initialize system RAM to zeroes
46      **      Reset display
47      **      Turn display on
48      **      Set display row drivers
49      **      Set display contrast nibble
50      **      Initialize DELAY parameters
51      **      Perform ColdStart configure
52      **      Create Statement Buffer
53      **      Initialize clock system
54      **      Check for low battery
55      **      Initialize flags and traps

```

```

56      **      Zero RAM between AVMEMS and RAMEND
57      **      Clear AUTO mode
58      **      Clear program running flag
59      **      Clear don't continue flag
60      **      Initialize IS-TBL table
61      **      Initialize PRINT and DISP position and width
62      **      Initialize ENDLINE string
63      **      Put Coldstart message in display
64      **      Create Workfile
65      **      Create file information buffer
66      **      Initialize random number seed
67      **      Perform coldstart fast poll
68      **

```

```
582 *****
583 **
584 ** Name:(S) pMNLP - Poll on entry to main loop
585 **
586 ** Category: POLL
587 **
588 ** Type: FPOLL
589 **
590 ** Purpose:
591 ** Poll on entry to main loop.
592 **
593 ** Should poll be "Handled" (return with XM=0)?:
594 ** NO!! NEVER!! Take over, yes. Handle, no.
595 **
596 ** Meaning of "Handling" Poll (what does code do if handled?):
597 ** N/A
598 **
599 ** Entry conditions for handler (registers, ST, RAM, etc.):
600 ** Carry set.
601 ** B[A] = Poll number = pMNLP.
602 ** HEX mode.
603 ** P=0.
604 **
605 ** Normal exit conditions from handler if handled (ST, RAM,
606 ** registers, etc.):
607 ** N/A
608 **
609 ** Normal exit conditions from handler if not handled (ST, RAM,
610 ** registers, etc.):
611 ** HEX mode.
612 ** XM=1.
613 **
614 ** Available subroutine levels:
615 ** 5
616 **
617 ** NOTE:
618 ** Machine is entering an idle state. This is a good time
619 ** to take over. This poll is one of the very first
620 ** things done on entry to main loop. We have not done
621 ** display scrolling, auto line#, collapsing stmt buffer,
622 ** checking for CALC mode, etc.
623 **
624 ** What registers/RAM may be used if handled?:
625 ** N/A
626 **
627 ** What registers/RAM may be used if not handled?:
628 ** All CPU registers except D[A].
629 ** All scratch RAM.
630 **
631 ** Special memory/pointer considerations (are pointers funny?):
632 ** May be in CALC mode. The routine fCALC? will RTNSC
633 ** if we are in CALC mode without using D[A].
634 **
635 ** Envisioned application(s):
636 ** Taking over, maybe?

998          **              SFLAGC, SFLAGS, ACBAT?
999          **
1000         ** Uses.....
1001         **              All CPU registers.  SCRTCH in RAM.
1002         **
1003         ** Stk lvls:   5
1004         **
1005         ** NOTE:
1006         **      This is how you put the machine to sleep.  If memory
1007         **      configuration changes while the machine is asleep,
1008         **      the soft-configured module which called DSLEEP may have
1009         **      moved.  Thus when DSLEEP tries to return, the machine
1010         **      will go out to lunch.  It is RECOMMENDED that you call
1011         **      DSLEEP through the MGOSUB utility:
1012         **      GOSBVL =MGOSUB
1013         **      CON(5) =DSLEEP
1014         **      Then if configuration changes, the GOSUB stack will be
1015         **      collapsed and the attempt to return from DSLEEP will
1016         **      give a SYSTEM ERROR.  This beats going out to lunch.
1017         **
1018         **      Secondary local entry point DPS010 is used by PWROFF.
1019         **
1020         ** Detail:
1021         **      Performs power-down poll on entry and one or two
1022         **      power-up polls on wakeup.  Control is returned to the
1023         **      calling routine in the following circumstances:
1024         **
1025         **      If ATTN key was not hit:
1026         **          An on-timer alarm is pending with program running
1027         **                      or
1028         **          A poll handler cleared =fITNOF on =pDSWNK poll.
1029         **
1030         **      If ATTN key was hit:
```

```
1031      **      R poll handler cleared =f1TNOF on =pDSWKY poll.
1032      **                               or
1033      **      Password is null
1034      **                               or
1035      **      User supplies correct password.
1036      **
1037      **      LOCK is implemented with the aid of the =f1TNOF and
1038      **      =f1MKOF flags. Proper manipulation thereof will keep
1039      **      the user from breaking into a locked machine. Guide-
1040      **      lines for their use are found in the poll interface
1041      **      descriptions below.
1042      **
1043      **      Some special things happen for the benefit of the
1044      **      PWROFF routine, since PWROFF returns control to the
1045      **      main loop upon wakeup. See PWROFF documentation for
1046      **      more detail, including explanation of =bECOMD.
1047      **
1048      ** Algorithm:
1049      ** DSLEEP: Clear =f1PWDN flag (indicate that we were not
1050      **      called from PWROFF).
1051      ** DPS010: (Entry point for PWROFF).
1052      **      If ON key down
1053      **          Set ATTN flag and goto DSP040
1054      **      If display-clear flag clear then goto DPS030
1055      **          Send <cursor on>/CR/LF.
1056      ** DPS030 Send <cursor off>
1057      ** DPS035: Perform power-down poll.
1058      **      Set TURNOFF (f1TNOF) flag.
1059      **      Clear MAKEOFF (f1MKOF) flag.
1060      **      Turn off display.
1061      **      Clear f-g shift status bits.
1062      **      Clear ATNFLG and ATNDIS.
1063      **      Turn off timer _#3 (Low battery check).
1064      **      Activate KB row with ATTN key.
1065      **      SHUTDN.
1066      **
1067      ** DPS040: Configure.
1068      **      Deallocate external command buffer (to give poll
1069      **      handlers a chance to create one if we were
1070      **      called by PWROFF).
1071      **      Check clock system
1072      **      If ATTN key woke us up, goto DPS200.
1073      **      If program running and ON TIMER pending
1074      **          Clear =f1TNOF; goto DPS200.
1075      **      Perform pDSWKN poll (who woke us up?!?).
1076      **      If turnoff flag set and ATNFLG clear then
1077      **          goto DSP035
1078      ** DPS200: Flush key buffer.
1079      **      Clear f1ALRM flag.
1080      **      =pDSWKY poll
1081      **      Password processing (does not require password if
1082      **      password=null or =f1TNOF is clear).
1083      **      If failed to unlock machine (password required but
1084      **      not correctly given), goto DPS035.
1085      **      AC/BAT check
```

1193      **
1194      ** Category:   POLL
1195      **
1196      ** Type:       FPOLL
1197      **
1198      ** Purpose:
1199      **   Poll on entry to deep sleep.
1200      **
1201      ** Should poll be "Handled" (return with XM=0)?:
1202      **   No.
1203      **
1204      ** Meaning of "Handling" Poll (what does code do if handled?):
1205      **   N/A
1206      **
1207      ** Entry conditions for handler (registers, ST, RAM, etc.):
1208      **   Carry set.
1209      **   B[A] = Poll number = pPWROF
1210      **   HEX mode.
1211      **   P=0.
1212      **   f1PWDN set iff deepsleep was called from PWROFF.
1213      **
1214      ** Normal exit conditions from handler if handled (ST, RAM,
1215      ** registers, etc.):
1216      **   N/A
1217      **
1218      ** Normal exit conditions from handler if not handled (ST, RAM,
1219      ** registers, etc.):
1220      **   HEX mode.
1221      **   XM=1.
1222      **
1223      ** Available subroutine levels:  3
1224      **
1225      ** NOTE:
1226      **   The flag f1PWDN indicates that the machine was called
1227      **   from PWROFF, as opposed to CALC mode, programmatic BYE,
1228      **   or somebody else.
1229      **
1230      **   This is a good time to take over.
1231      **
1232      ** What registers/RAM may be used if handled?:
1233      **   N/A
1234      **
1235      ** What registers/RAM may be used if not handled?:
1236      **   All CPU registers except D[A].

```

```
1237      **      All scratch RAM.
1238      **
1239      ** Special memory/pointer considerations (are pointers funny?):
1240      **      May be in CALC mode.
1241      **
1242      ** Envisioned application(s):
1243      **      Some sort of takeover on shutdown.
1244      **
1245      **      Pocket secretary processing alarms at shutdown.
1246      **      Suggested method if an alarm is due and you want to
1247      **      process it at power-off:
1248      **      Schedule immediate wakeup through external alarm.
1249      **      Create external command buffer at wakeup poll using
1250      **      the pocket secretary's handy ACKNOWLEDGE keyword.
1251      **
1252      ** History:

1261      ** *****
1262      **
1263      ** Name:(S) pDSWNK - Poll to awake machine w/o key
1264      **
1265      ** Category:  POLL
1266      **
1267      ** Type:      FPOLL
1268      **
1269      ** Purpose:
1270      **      Poll if machine awoke without ATTN being hit or
1271      **      ON TIMER going off.
1272      **
1273      ** Should poll be "Handled" (return with XM=0)?:
1274      **      No. I don't think so.
1275      **
1276      ** Meaning of "Handling" Poll (what does code do if handled?):
1277      **      N/A
1278      **
1279      ** Entry conditions for handler (registers, ST, RAM, etc.):
1280      **      Carry set.
1281      **      B[A] = Poll number.
1282      **      HEX mode.
1283      **      P=0.
1284      **
1285      ** Normal exit conditions from handler if handled (ST, RAM,
1286      ** registers, etc.):
1287      **      N/A
1288      **
1289      ** Normal exit conditions from handler if not handled (ST, RAM,
1290      ** registers, etc.):
1291      **      HEX mode.
```

```

1292      **      XM=1.
1293      **      If flTNOF is cleared during this poll, the machine will
1294      **      wake up AND will circumvent password processing
1295      **      (asking for password if one exists). If you wish to
1296      **      wake up the machine this way but not give control to
1297      **      the user, setting flMKOF will force machine back to
1298      **      sleep as soon as it hits the main loop. This is a
1299      **      way to wake up to process alarms and then return to
1300      **      sleep.
1301      **      If ATNFLG is set during this poll, the machine will
1302      **      continue as though ATTN had been hit... wake up,
1303      **      perform password processing, etc.
1304      **
1305      ** Available subroutine levels: 3
1306      **
1307      ** NOTE:
1308      **      The flag flPWDN indicates that the machine was called
1309      **      from PWROFF, as opposed to CALC mode, programmatic BYE,
1310      **      or somebody else. The importance of this is that on
1311      **      return from DSLEEP, PWROFF will recognize and process
1312      **      an external command buffer. Nobody else will. So if
1313      **      you wish to create a command buffer to be executed,
1314      **      flPWDN indicates whether or not it will be ignored.
1315      **
1316      **      The external command buffer was deallocated before the
1317      **      wakeup polls. If it currently exists, it means that a
1318      **      poll handler has created it. Think real hard about
1319      **      how badly you want to wipe out somebody else's command.
1320      **      On the other hand, some externally implemented sort of
1321      **      STARTUP may grab this buffer every time. Such are the
1322      **      dangers in this zoo. I guess this means not to assume
1323      **      that creating this buffer guarantees that it will be
1324      **      used.
1325      **
1326      ** What registers/RAM may be used if handled?:
1327      **      N/A
1328      **
1329      ** What registers/RAM may be used if not handled?:
1330      **      All registers except D[A].
1331      **      All scratch RAM.
1332      **
1333      ** Special memory/pointer considerations (are pointers funny?):
1334      **      May be in CALC mode.
1335      **
1336      ** Envisioned application(s):
1337      **      Allowing non-ATTN, non-ON-TIMER to awake machine.
1338      **

1642          *****
1643          *****
1644          **
1645          ** Name:(S) CKSREQ - Handle service requests
1646          **
1647          ** Category:  GENUTL
1648          **
1649          ** Purpose:
1650          **   Handle service requests. This routine recognizes
1651          **   several possible sources of service requests:
1652          **       1) Timer 1--Display code needs service.
1653          **       2) Timer 2--Clock system needs service.
1654          **       3) Timer 3--Battery check code needs service.
1655          **
1656          **   After examining above, CKSREQ performs a poll which
1657          **   allows:
1658          **       1) Handling of SREQs we don't recognize.
1659          **       2) Handling related to recognized SREQs (e.g.,
1660          **          scheduling a new external alarm through clock
1661          **          system).
1662          **
1663          **   This code is typically called when:
1664          **       1) We wake up from a sleep state (delay, etc.).
1665          **       2) We recognize that an SREQ is exerted at certain
1666          **          points in the mainframe (e.g., interpreter loop).
1667          **
1668          ** Entry:
1669          **   Hex Mode

1739      ** Type: FPOLL
1740      **
1741      ** Purpose:
1742      ** Allow LEXFILE processing when a hardware service
  
```

```
1743      **      request is exerted.
1744      **
1745      ** Should poll be "Handled" (return with XM=0)?:
1746      **      NO!! NEVER!!
1747      **
1748      ** Meaning of "Handling" Poll (what does code do if handled?):
1749      **      N/A
1750      **
1751      ** Entry conditions for handler (registers, ST, RAM, etc.):
1752      **      Carry set.
1753      **      B[A] = pSREQ.
1754      **      HEX mode.
1755      **      P=0.
1756      **      fLDORM flag is set if machine is in main loop
1757      **      (dormant).
1758      **
1759      ** Normal exit conditions from handler if handled (ST, RAM,
1760      ** registers, etc.):
1761      **      N/A
1762      **
1763      ** Normal exit conditions from handler if not handled (ST, RAM,
1764      ** registers, etc.):
1765      **      HEX mode.
1766      **      XM=1.
1767      **
1768      ** Available subroutine levels:
1769      **      2
1770      **
1771      ** NOTE:
1772      **      D[A], and R0-R4 must be preserved.
1773      **
1774      **      ■ copy of the user's status bits as they existed on
1775      **      entry to CKSREQ exists at DSPSTA (the 3 nibbles used
1776      **      by display routines to save status bits). Do not
1777      **      destroy this copy; it is needed so ST can be restored
1778      **      after the poll.
1779      **
1780      **      The available scratch RAM is, conveniently, just enough
1781      **      to use the clock system safely. You can save R0 and R1
1782      **      at SCRCH, D[A] at SCREX0, and subroutine levels in
1783      **      SCREX1, SCREX2, SCREX3.
1784      **
1785      **      This poll IS NOT a time to take over the machine. It
1786      **      may occur during display delay, program execution,
1787      **      character editing, wait, etc. This poll IS a time for
1788      **      handling service requests non-disruptively (such as
1789      **      scheduling an alarm, doing a beep, setting the
1790      **      exception flag, or anything else which does not disrupt
1791      **      the flow of whatever was going on when you generated
1792      **      your service request) and for setting up to take over
1793      **      the machine (such as setting ■ flag which tells you to
1794      **      grab the exception poll or the deepsleep poll).
1795      **
1796      ** What registers/RAM may be used if handled?:
1797      **      N/A
```

```

1798      **
1799      ** What registers/RAM may be used if not handled?:
1800      **      A-C, D[15-5], D0, D1, P, ST.
1801      **      First 32 nibbles at SCRTCH.
1802      **      SCREX0, SCREX1, SCREX2, SCREX3.
1803      **
1804      ** Special memory/pointer considerations (are pointers funny?):
1805      **      We could be in CALC mode.
1806      **
1807      ** Envisioned application(s):
1808      **      Scheduling external alarms though the clock system is
1809      **      one very important application. If a few simple rules
1810      **      are followed when dealing with the clock system,
1811      **      everything should work just fine:
1812      **
1813      **      Rule #1: If the current external alarm is past due
1814      **      (before current time), you may schedule an
1815      **      external alarm.
1816      **      Rule #2: If the current external alarm is not past
1817      **      due, you may only schedule an external alarm
1818      **      if a) your alarm is not past due, and b) it
1819      **      occurs before the currently scheduled
1820      **      external alarm.
1821      **      Rule #3: You can tell if one of your alarms is
1822      **      pending by comparing it to the current time.
1823      **      Do not count on the current value in the
1824      **      external alarm slot being yours... somebody
1825      **      may have followed rule #2 and jumped in
1826      **      ahead of you.
1827      **
1828      **
1829      **      Another application: Remote Keyboard. Presumably your
1830      **      code is associated with some hardware (an HPIL mailbox,
1831      **      maybe) which has exerted a service request because of a
1832      **      remote keyboard. Take this poll as an opportunity to
1833      **      stuff a key# in the keybuffer. If it is not a key#
1834      **      which can be understood by the machine, you can define
1835      **      it by handling the key definition poll.
1836      **

1845          STITLE KYDN?
1846          *****
1847          *****
1848          **
1849          ** Name:(S) KYDN? - Is a Key Down in Current Row?
1850          **
1851          ** Category:  CONFIG
1852          **
1853          ** Purpose:
1854          **     Determine if a key is down which could cause a problem
1855          **     for configuration.
1856          **
1857          ** Entry:
1858          **
1859          ** Exit:
1860          **     Carry clear if a key is down in the currently energized
1861          **     row(s), else carry clear.
1862          **
1863          ** Calls:      None.
1864          **
1865          ** Uses.....
1866          **             None.
1867          **
1868          ** Stk lvls:   1
1869          **
1870          ** NOTE:
1871          **     A brief description of the problem: If 2 or more keys
1872          **     are down in a column, and a row containing one of the
1873          **     keys is energized, the multiple keys short the rows
1874          **     together, resulting in energizing multiple rows. In
1875          **     configuration, this amounts to addressing more than one
1876          **     port daisy chain at once, which can lead to disaster.
1877          **     This routine is called at appropriate times to ensure
1878          **     that no keys are down that can screw up configuration.
1879          **
1880          ** Detail:
1881          **     Preserves all registers at the expense of a subroutine
1882          **     level.
1883          **

```

```
11 *****
12 *****
13 **
```

```
14 ** Name: (S) ASCII - ASCII Bit Pattern Tables
```

```
15 **
```

```
16 ** Category: DSPUTL
```

```
17 **
```

```
18 ** Purpose:
```

```
19 ** Bit patterns for built in character set.
```

```
20 **
```

```
21 ** Detail:
```

```
22 ** The bit pattern for each character requires 10
23 ** nibbles. Each of the 5 pairs of nibbles defines
24 ** one display column. Each column has 8 bits where
25 ** the lsb of the byte is the top row and the msb is
26 ** the bottom row. The bit pattern for an ASCII char
27 ** may be found by reading 10 nibbles at the address
28 ** ASCII + 10 * (Char#).
```

```
29 **
```

```
30 ** History:
```

```
31 **
```

```
32 **      Date      Programmer      Modification
```

```
33 ** -----
```

```
34 ** 07/29/83  B.S.      Updated documentation

8      TITLE  F & G Shift Table<831212.1206>
9 OOC9B      ABS  WOOC9B
10 *****
11 *****
12 **
13 ** Name:(S) FGTBL - State table for F & G shifted keys
14 **
15 ** Category:  KEYUTL
16 **
17 ** Purpose:
18 **   This table defines a state machine used to determine
19 **   how to process f and g shifted keys
20 **
21 ** Entry:
22 **   Do not enter
23 **
24 ** Detail:
25 **   The state machine has 7 input bits and 4 output bits.
26 **   The seven input bits are as follows
27 **     Bit 6  F key currently down
28 **     Bit 5  G key currently down
29 **     Bit 4  Some non-FG key newly down
30 **     Bit 3  g annunciator on
31 **     Bit 2  f annunciator on
32 **     Bit 1  Ghost bit
33 **     Bit 0  F or G key was down during last key scan
34 **   The ghost bit is used to indicate that an f or g
35 **   shift has been performed but the annunciator was
36 **   left on because the corresponding key was still
37 **   down.
38 **   The lower 4 bits are stored between key scans
39 **   in the display RAM nibble that contains the f and
40 **   g annunciators. The lower two bits do not affect
41 **   the display since there are no annunciators in the
42 **   LCD to correspond to these bits.
43 **   These 7 bits form an offset into the table
44 **   which gives the new "state" of the state machine
45 **   and is stored back into display memory. If
46 **   bit 4 is set but bits 5 and 6 are clear then
47 **   all bits should be cleared following putting the
48 **   f or g modified key codes in the buffer.
49 **
50 ** History:
51 **
52 **   Date      Programmer      Modification
53 **   -----
54 **   10/18/83  B.S.           Updated documentation

9      TITLE Keyboard Driver (14 Column Keyboard)<831216.1604>
10 OOCF7 ABS #OOCF7
11 *****
12 *****
13 **
14 ** Name:(S) DEBNCE - Debounce and scan keyboard
15 ** Name:(S) KEYSCN - Scan keyboard
16 **
17 ** Category: KEYUTL
18 **
19 ** Purpose:
20 ** Scans keyboard and puts all new keys in key buffer
21 **
22 ** Entry:
23 **
24 ** Exit:
25 ** P = 0
26 ** DO=(5) =DISINT (except for WARMST exit)
27 **
28 ** Calls: None
29 **
30 ** Uses.....
31 ** Inclusive: A(W),B(W),C(W),DO
32 **
33 ** Stk lvls: 0
34 **
35 ** Detail:
36 ** The keyboard is scanned and a bit map of all keys
37 ** down is made. If the number of keys down (not
38 ** counting the ON key is greater than 3 then no change
39 ** is made to the bit map or key buffer and KEYSCN
40 ** returns immediately. The map is compared to the map
41 ** that was made the last time the routine was called.
42 ** The new bit map is saved for the next call. All keys
43 ** that have gone down since the last call (up to 7 new
44 ** keys) are added to the key buffer (space permitting).
45 ** The logical keycodes for unshifted keys that are
46 ** generated and stored in the buffer are as follows:
47 **
48 **
49 ** +---+---+---+---+---+---+---+---+---+---+---+---+---+---+---+
50 ** | Q | W | E | R | T | Y | U | I | O | P | 7 | 8 | 9 | / |

A(S)=3 (Maximum number of keys)
Next instrs. not interruptable
Activate a key row line
Read active key columns

Is ON key down?
Yes then turn on bit
Shift off left 6 bits
Any bits on in this row?
No, then go to next row
Shift off highest bit
Skip if bit was clear
Mark proper bit in map
Decrement number of keys
Exit loop if more that 3 keys
Move to next column
Loop until all columns done
Reset pointer for next row
Change constant for next row
Loop until all rows done

Leave key rows enabled

377          ** Category: KEYUTL
378          **
379          ** Purpose:
380          **     Prompts user for recovery level. Allows control to
381          **     be regained from microcode infinite loops.
382          **
383          ** Entry:
384          **
385          ** Exit:
386          **     Depends on user response. See Detail.
387          **
388          ** Detail:
389          **     "INIT:" is sent to display. The display is
390          **     turned on and the keyboard is scanned. If the user
391          **     presses a digit key in the valid range (below) the
392          **     digit is displayed. When the End Line key is pushed
393          **     the warm start requested is performed. The warm
394          **     start levels are as follows:
395          **
396          **         1: Clear USER mode then jump to MAINLP
397          **         2: Perform ROM test, Clear USER then jump to MAINLP
398          **         3: Cold Start
399          **

63      FLDEVX  STITLE Make File Device Code Explicit
64      *****
65      *****
66      **
67      ** Name:(S) FLDEVX  - Make Device Code Explicit
68      ** Name:    FLDEV+ - Make Device Code Explicit
69      **
70      ** Category:  EXCUTL
71      **
72      ** Purpose:
73      **      Maps the FSPECx device code into the FIB device code
74      **      without having to find the file using FINDF. In certain
75      **      cases maps unspecified device states to appropriate code.
76      **
77      **      For SOURCE device:
78      **      Does NOT map undefined device to MAIN. Identifies port
79      **      if explicit. Returns carry set only for illegal port.
80      **
81      **      For DESTINATION device:
82      **      Maps undefined device to MAIN, explicitly identifies
83      **      port. Returns carry set for illegal or unspecified
84      **      port.
85      **
86      ** Entry:
87      **      S3(sDEST) = 0 if SOURCE file (see above), 1 if DEST file.

389 MEMCKL STITLE MEMCKL - Memory Check with Leeway
390 *****
391 *****
392 **
393 ** Name:(S) MEMCKL - Check Avail Memory With, Without Leeway
394 ** Name: MEMCK+ - Check Avail Memory With, Without Leeway
395 ** Name: CHKSPC - Check Available Memory With Leeway
396 ** Name: CHKSPF - Check Available Memory Without Leeway
397 ** Name:(S) CHKMem - Check Available Memory Without Leeway
398 **
399 ** Category: PTRUTL
400 **
401 ** Purpose:
402 ** See if requested memory amount [+ Leeway] is less than
403 ** or equal to available memory. Nonzero value of P on
404 ** entry determines whether leeway will be included in
405 ** check for some entry points. "Insufficient Memory"
406 ** error code is returned with carry set if requested
407 ** amount exceeds the available memory.
408 **
409 ** Entry:
410 ** MEMCKL:
411 ** C(A) = Absolute amount memory to check
412 ** P = 0 iff LEEWAY to be added to amt being checked
413 ** MEMCL+:
414 ** B(A) = Absolute amount memory to check
415 ** P = 0 iff LEEWAY to be added to amt being checked
416 ** CHKSPC: (LEEWAY ALWAYS added; B(A) not used)
417 ** C(A) = Absolute amount memory to check
418 ** P = 0
419 ** CHKSPF: (LEEWAY NEVER added; B(A) not used)
420 ** C(A) = Absolute amount memory to check
421 ** D1 @ Available memory end pointer
422 ** CHKMem: (LEEWAY NEVER added; B(A) not used)
423 ** A(A) = Available memory end
424 ** C(A) = Absolute amount memory to check
425 ** P = 0
426 **
427 ** Exit:
428 ** Carry Clear: Enough memory
429 ** B(A) = Amount to check (MEMCKL, MEMCL+ only)
430 ** A(A) = Available Memory start
431 ** D1 @ AVMEMS
432 ** C(A) = Available memory MINUS requested amount
433 ** (MINUS Leeway if also checked)
434 ** P = 0
435 ** Carry set: Not enough memory

496 MFDEVC STITLE Mainframe Device Check
497 *****
498 *****
499 **
500 ** Name: MFDEVC - Mainframe Device Check on File Info
501 ** Name: MFDVC- - Mainframe Device Check on File Info
502 ** Name: MFDVC+ - Mainframe Device Check on Selected File
503 **
504 ** Category: FILUTL
505 **
506 ** Purpose:
507 ** Indicate whether device is in mainframe, on card, or on
508 ** HPIL. MFDVC+ calls RDINFO before the check is made.
509 ** MFDEV- performs like MFDEVC, but will leave sCARD (S2)
510 ** UNTOUCHED if the device is not CARD or PCRD.
511 **
512 ** Entry:
513 ** P = 0
514 ** Source, dest file info on the Save Stack as per SVINFO
515 ** MFDEVC, MFDEVC-:
516 ** D(A) = Device code as per RDINFO
517 ** MFDVC+:
518 ** S3(sDEST) = 1 if destination file info is to be read
519 ** before falling into MFDEVC
520 ** = 0 if destination file info is to be read
521 ** before falling into MFDEVC
522 **
523 ** Exit:
524 ** S2(sCARD) = Set if device is CARD or PCRD (all entry
525 ** pts), else it is CLEARED (MFDEVC and
526 ** MFDEV+ only)
527 ** SO(sEXTDV) = Set if device is HPIL,
528 ** else it is UNCHANGED
529 ** D(A) = Device code from RDINFO (NOTE: This code
530 ** has been shifted one nibble left circular
531 ** from where FSPECx originally returned it)
532 ** C(0) = 7 (CARD device code, =dCARD)
533 ** C(4-1) = D(4-1) exit condition
534 ** P = 0
535 ** Carry = Clear
536 ** MFDVC+ also exits with:
537 ** A = First 8 characters of file name
538 ** RO = Last 2 characters of file name
539 **
540 ** Calls: RDINFO.

622      MVMEM  STITLE Move File Memory W/Ref Adjust
623      ****
624      ****
625      **
626      ** Name:      MVMEM  - Move File Memory W/Ref Adjust
627      ** Name:(S) MVMEM+ - Move File Memory W/Ref Adjust
628      **
629      ** Category:   GENUTL
630      **
631      ** Purpose:
632      **      Move memory in a file chain up or down with reference
633      **      adjust. Works for either MAIN or Independent RAM.
634      **      RFADJ is called, and pointers MAINEN -> AVMEMS and
635      **      CURRST -> CURREN are updated if they fall into the
636      **      block that moved. Note that if the pointer value falls
637      **      outside the block that moved but inside the area into
638      **      which it moved, no action is taken. If the source of
639      **      the move is NOT EQUAL to the corresponding file header
640      **      address passed in C(A), then that file header's chain
641      **      length is also adjusted.
642      **
643      ** Entry:
644      **      A(A)  = Starting address to move up or down. Equal
645      **              to C(A) if adding or deleting file to/from
646      **              file chain.
647      **      B(A)  = Offset (dest address - source address)
648      **      C(A)  = Address of header of file containing address
649      **              to be moved. File chain length field of the
650      **              header will be updated to new length if and
651      **              only if C(A) # A(A). If adding or deleting a
652      **              file to or from the chain, this address should
653      **              point to the following file header in the file
654      **              chain or to the end of the chain.
655      **      P      = 0
656      **      MVMEM:
657      **      D(S)  = Device code for memory device
658      **      D(B)  = Port number if port device
659      **      D(7-2) = Nibs 8-3 of port's configuration table entry
660      **      MVMEM+:
661      **      D entry state will be computed from C(A)
662      **

1156 RSTK<R STITLE Restore RSTK Level(s) From RAM
1157 *****
1158 *****
1159 **
1160 ** Name: (S) RSTK<R - Restore RSTK Level(s) From RSTKBF Buffer
1161 **
1162 ** Category: SAVUTL
1163 **
1164 ** Purpose:
1165 ** Restore Return Stack Level(s) from circular buffer.
1166 ** Levels are saved and restored on a last-in-first-out
1167 ** (LIFO) basis (see R<RSTK for save routine). The buffer
1168 ** holds up to 16 levels. No more than 6 levels should be
1169 ** saved or retored in one call, however, since the return
1170 ** to the caller of RSTK<R requires one level.
1171 **
1172 ** Entry:
1173 ** P = n - 1, where n is number of levels to restore
1174 ** (not counting return to caller of R<RSTK)
1175 **
1176 ** Exit:
1177 ** Carry = Clear
1178 ** P = 0
1179 ** DO @ RSTKBp RAM location
1180 **
1181 ** Calls: RSTK>1
1182 **
1183 ** Uses.....
1184 ** Inclusive: C(A), C(S), B(A), DO
1185 **
1186 ** Stk lvls: n (n levels are ADDED to the stack on return)
1187 **
1188 ** NOTE:
1189 ** The addresses stored in the buffer are NOT updated by
1190 ** RFADJ.
1191 **
1192 ** Detail:
1193 ** The position in the circular buffer is indicated by
1194 ** the nibble =RSTKBp in System RAM, which points to the
1195 ** last position written.
1196 **
1197 ** During the routine:
1198 ** C(S) = Level counter (from P on entry)
1199 ** P = Circular buffer position (from =RSTKBp)
1200 ** These counters are set up by routine RSTK>1, which is
1201 ** shared by RSTK<R and R<RSTK.
1202 **
1203 ** History:

378          **     by calling OUT1TK. After buffer is built, a CR is
379          **     written to the end of the buffer. STKCMD is called
380          **     to edit the command stack. Pointers from RPNBFR
381          **     to AVMEMS are updated to point to new end of buffer.
382          **     If there is less than LEEWAY memory left, commands
383          **     in the command are crushed, starting with the oldest,
384          **     until LEEWAY available memory exists or all but the
385          **     most recent command have been crushed.
386          **

385          **
386          ** Purpose:
387          **     Process service request for display code.
388          **     Service request can be generated by TIMER1 and is used
389          **     either for:
390          **         1) Cursor blink, or
391          **         2) End of display delay.
392          **
393          ** Entry:
394          **     P=0.
395          **
396          ** Exit:
397          **     P=0.
398          **
399          ** Calls: GETSTA,D1=FC,BLDBIT,BLDB40,WRTTM1,SETSTA
400          **
401          ** Uses.....
402          **     Inclusive: A(W),B(W),C(W),D(W),DO,D1,RAM(DSPSTA)
403          **
404          ** Stk lvls: 2
405          **
406          ** NOTE:
407          **     Saves contents of ST on entry into DSPSTA. Restores
408          **     on exit.
409          **
410          ** Algorithm:
411          **     Stores callers status bits in DSPSTA and recalls
412          **     display status.
413          **     Sets TimOut bit to indicate timer has timed out.
414          **     If UpdOff then display doesn't need updating so
415          **     set timer to a long time and return.
416          **     If CurOff then cursor is off and thus display
417          **     doesn't need updating so set timer to a long
418          **     time. TimOut was set above which notes the
419          **     fact that the timer has timed out. This is
420          **     used for display delay during line feed.
421          **     If BitsOK then the LCD reflects the display buffer
422          **     and doesn't require rebuilding just to change
423          **     cursor. If not BitsOK then we need to rebuild
424          **     the LCD to make sure cursor will make sense, this
425          **     code will fall back through DSPUPD once display
426          **     has been updated.
427          **     Now need to change cursor.
428          **     The position of the cursor in the display is
429          **     calculated by looking at CURSOR, WINDST and WINDLN.
430          **     If the cursor isn't in display then set the timer
431          **     to a long time and return.
432          **     Depending on the Phase, either

```

```

433      **      * Rebuild the character that belongs in cursor
434      **              position and toggle phase.
435      **      * Check if replace or insert cursor is required,
436      **              build it in display, toggle phase and return.

709          **
710          ** Uses.....
711          **   Inclusive: A(W),B(W),C(W),D(W),DO,D1,RAM(See note below)
712          **
713          ** Stk lvls:   2
714          **
715          ** NOTE:
716          **   This routine will call CKSREQ if CR or LF is sent.
717          **   This implies that a poll may happen. That will cause
718          **   certain RAM locations (SNAPSHOT) to be altered.
719          **   This routine uses R<RSTK / RSTK<R to preserve stack
720          **   levels--this also uses RAM.
721          **
722          **   This routine may also transfer control out to HPIL.
723          **   The HPIL ROM may not have exactly the same register
724          **   usage for ■ given character, ie don't assume a certain
725          **   character will leave ■ certain register preserved
726          **   just because this code doesn't seem to use it. For
727          **   any character, A,B,C,D,DO,D1 may be used.
728          **
729          ** Detail:
730          **   This routine provides the mechanism to access the
731          **   pseudo-device that controls the display.
732          **   This device has 3 nibbles of status that are
733          **   defined as follows:
734          **   S0 -- Miscellaneous uses
735          **   S1 -- Set iff LCD currently matches display buffer

```

```

736      **      S2 -- Cursor blink phase
737      **      S3 -- Display needn't contain cursor
738      **      S4 -- Disable cursor update
739      **      S5 -- Display buffer needs to be cleared(1)
740      **      S6 -- Cursor on(0)/off(1)
741      **      S7 -- Insert(1)/Replace(0) mode
742      **      S8 -- Cursor/FirstC need to be cleared(1)
743      **      S9 -- Suppress Delay(1) (Auto-clears)
744      **      S10 -- Display has timed out
745      **
746      **      The pseudo-device accepts the following escape
747      **      sequences:
748      **      Esc Q -- Insert cursor
749      **      Esc R -- Replace cursor
750      **      Esc C -- Cursor right
751      **      Esc D -- Cursor left
752      **      Esc H -- Home cursor
753      **      Esc J -- Clear Display
754      **      Esc K -- Delete through end of line
755      **      Esc > -- Cursor on
756      **      Esc < -- Cursor off
757      **      Esc E -- Reset display
758      **      Esc P -- Delete char
759      **      Esc Z <col> <row> -- Set cursor position absolute
760      **      Esc Ctrl-C -- Cursor far right
761      **      Esc Ctrl-D -- Cursor far left
762      **
763      **

9      TITLE HP-71 Rom Test <831212.1205>
10 02484 ABS #2484

```

```

11      *
12      ****
13      ****
14      **
15      ** Name:      ROMTST - System ROM checksum test
16      **
17      ** Category:   SYSTEM
18      **
19      ** Purpose:
20      **      Perform ROM checksum on the four system ROMs.
21      **
22      ** Entry:
23      **      P      = 0
24      **
25      ** Exit:
26      **      P=0, carry set
27      **
28      ** Calls:      BF2BLD, DSPCHA, BLDDSP, RCKBp
29      **
30      ** Uses.....
31      **      Exclusive: A,B,C,D,R0,R1,D1,D0,P, OUT register
32      **      Inclusive: A,B,C,D,R0,R1,D1,D0,P, OUT register
33      **
34      ** Stk lvls:   3
35      **
36      ** Detail:
37      **      The ROM test is performed as a checksum, on all 4 chips.
38      **      Results are reported on the beeper as follows:
39      **      Three tones are used (at nominal 400Khz) ---
40      **      617Hz Medium tone indicates "results follow"
41      **      775Hz High tone indicates "ROM chip OK"; chip #1 will
42      **      beep once, chip #2 will beep twice, etc.
43      **      438Hz Low tone indicates "ROM chip BAD"; chip #1 will
44      **      beep once, chip #2 will beep twice, etc.
45      **
46      ** -----
47      **
48      **      This ROM test depends on system RAM (namely the RAM
49      **      accessed by the display code). A RAM failure might
50      **      prevent the ROM test from being run properly, but this
51      **      would most likely show up as a complete failure of
52      **      the HP-71: a permanent "Memory Lost" message, or the
53      **      display locked up with other characters.
54      **
55      **      The ROM test does not depend on code in ROM chips 2,3

```

```

56      ** and 4. A failure of ROM chip #1 might preclude a test
57      ** of the other three ROMs.
58      **
59      ** The ROM test includes a communication link with an
60      ** Electronic Tester device. This link was set up for
61      ** automatic testing of production line components, and
62      ** implemented on the Self-Check ROM. The ET communication
63      ** scheme is as follows:
64      **      -- When the test is completed, a preamble is sent out
65      **      on the OUT register indicating "test results follow":
66      **
67      **          OUT register= "OFF" , held for 600 usec (nominal
68      **          at 400KHZ)
69      **
70      **      -- After preamble, report test results on OUT register
71      **      as follows: OUT reg= "0xt", where
72      **          "t"= test code ("t"=8 for ROM test)
73      **          and "x"=bitwise results (e.g., "x"="1010" means chips
74      **          one and three are bad, chips 2 and 4 are good).
75      **          This is held on the OUT register for 600 usec, also.
76      **
77      **      If the ET is not hooked up, no problem: this is a one-way
78      **      communication, at this point. See the HP-71 Self-Check
79      **      ROM for more details on the ET communication link; the
80      **      full scheme includes two-way communications.

15     *****
16     **
17     ** Name:(S) LINEP  - Parse Main Driver after ENDLINE
18     ** Name:(S) LINEP+ - Parse Main Driver from anywhere
19     ** Name:(S) LNPEXT - Parse Main Driver external entry
20     ** Name:(S) LNEP66 - Parse Main Driver return entry
21     **
22     ** Category:  PARUTL
23     **
24     ** Purpose:  Main driver routine to parse a line:
25     **            1) LINEP entry is called by MAINLP after
26     **               ENDLINE is entered on an input line.
27     **            2) LINEP+ entry is called to parse a
28     **               line, regardless of where the line is.
29     **               Used by direct execute keys (colon
30     **               key definitions) and STARTUP.
31     **            3) LNPEXT entry is the 'external parse'
32     **               entry. By setting FIRTN, it ensures
33     **               that in all cases (including errors),
34     **               control returns to the caller. Used
35     **               by TRANSFORM.
36     **
37     ** Entry:    3 entry points:
38     **            1) LINEP - Line to be parsed is in the display
39     **                       buffer.
40     **            2) LINEP+ - INBS points to start of input line.
41     **            3) LNPEXT - External Parse Entry
42     **                       Needed statuses (including S13) should
43     **                       be saved. INBS points to start of
44     **                       input line. OUTBS points to where
45     **                       tokenized line should go.
46     **                       AUTINC should be zero - may be default
47     **
48     ** Exit:
49     **      LINEP:
50     **          If valid program statement(s)
51     **          It is edited into current program file
52     **          If valid calculator BASIC statement(s)
53     **          (including implied DISP)
54     **          It is executed
55     **          Else ERROR exit

```

```

311      **
312      ** Name:(S) pPARSE - Parse Take Over Poll
313      **
314      ** Category:  POLL
315      **
316      ** Type:      FPOLL
317      **
318      ** Purpose:
319      **      Parse take-over to allow a LEX file to parse an input
320      **      line as other than BASIC
321      **
322      ** Should poll be "Handled"
323      **      Don't worry about XM, since if handled, there's no return
324      **
325      ** Meaning of "Handling" Poll (what does code do if handled?):
326      **      Parses line, acts accordingly, returns to MAINLP.
327      **
328      ** Entry conditions for handler (registers, ST, RAM, etc.):
329      **      Carry set
330      **      B[A] = Poll number.

```

```

331      **      HEX mode.
332      **      P=0.
333      **      INBS points to input line
334      **
335      ** Normal exit conditions from handler if handled (ST, RAM,
336      ** registers, etc.):
337      **      Return to MAINLP
338      **
339      ** Normal exit conditions from handler if not handled (ST, RAM,
340      ** registers, etc.):
341      **      HEX mode.
342      **      XM=1.
343      **
344      ** Available subroutine levels:
345      **      5
346      **
347      ** NOTE:
348      **

16          **
17          ** Name:(S) WRDSCN - Keyword Scan from Table
18          ** Name:(S) WRDSC+ - Keyword Scan from Table
19          **
20          ** Category: PARUTL
21          **
22          ** Purpose:
23          ** WRDSCN tries to match the text pointed to by D1 with
24          ** any of the keywords specified by the caller; the
25          ** acceptable keyword tokens are listed in table format
26          ** immediately following the call to WRDSCN or WRDSC+. If
27          ** one of the specified keywords is found, its corresponding
28          ** tokenization is output and control branches to the label
29          ** specified by the WRDSCN table.
30          **
31          ** To accomplish this, WRDSCN repeatedly calls NTOKEN until
32          ** token match is found or until all keyword tables in the
33          ** HP-71 have been searched.
34          **
35          ** The WRDSC+ entry point is identical to the WRDSCN entry,
36          ** except that WRDSC+ first calls RESPTR.
37          **
38          ** Entry:
39          ** D(A) = (AVMEME)
40          ** Table address is on return stack upon entry
41          ** (ie. table immediately follows GOSUB.)
42          ** D0 points into output buffer
43          **
44          ** WRDSC+: LEXPTR contains address pointing to optional
45          ** blanks preceding characters to tokenize.
46          ** WRDSCN: D1 at optional blanks preceding characters
47          ** to tokenize.
48          **
49          ** Exit:
50          ** P=0
51          ** Match found=>
52          ** No return to caller; control transferred to
53          ** specified label.
54          ** Token output to address pointed to by D0
55          ** Specified token in register A
```

```

56      **          D1 past specified keyword
57      **          D0 past keyword tokenization
58      **
59      **          Match not found=>
60      **          Return with carry clear
61      **          Last token found in A(B)
62      **          D1 past corresponding keyword
63      **
64      ** Calls:      NTOKEN,RESCAN,OUTNBS,RESPTR,XCHECK,XCHK1
65      **
66      ** Uses.....
67      ** Exclusive: A,B,C,R1,R2
68      ** Inclusive: A,B,C,R1,R2,S0-S3,S11,R0
69      **
70      ** Stk lvls:   3
71      **
72      ** Detail:
73      **
74      **          Sample call:
75      **
76      **          GOSUBL =WRDSCN
77      **          CON(2) =tBASE          1-byte token
78      **          REL(3) =FIXP          If tBASE found, goto FIXP
79      **          CON(6) =tANGLE        3-byte token
80      **          REL(3) OPTP10         If found, goto OPTP10
81      **          CON(6) =tROUND        3-byte token
82      **          REL(3) OPTP20         If found, goto OPTP20
83      **          CON(2) 0              00 byte terminates table
84      **          .....
85      **          code continues here
86      **
87      **          -----
88      **
89      **          How it works:
90      **
91      **          Calls the lexical analyzer and scans through table
92      **          trying to match one of the tokens(XWORD or regular)
93      **          and jumps to an address specified in the table
94      **          table for that token.
95      **          If the token returned by the lexical analyzer is not
96      **          matched but is an XWORD, the lexical analyzer is
97      **          restarted and the table is re-scanned from the
98      **          beginning.
99      **          If no match can be found then execution continues
100     **          following the end of the table.
101     **
102     **          The table consists of any number of entries, where
103     **          each entry is a token followed by a 3-nibble relative
104     **          address which is branched to if that token is matched.
105     **          A token may be either 2 or 6 nibbles long, depending
106     **          on whether it is an XWORD/XFN/FFN token versus a
107     **          mainframe token. The table is terminated by a 00
108     **          token; the table is immediately followed by the code
109     **          to handle the "otherwise" case (ie. the table has been
110     **          skipped over).

854          STITLE RESTAR - Restart Lex Analyzer
855          *****
856          *****
857          **
858          ** Name:    RESTAR - Restart Lex Analyzer
859          ** Name:(S) REST* - Restart Lex Analyzer
860          **
861          ** Category:  PARUTL
862          **
863          ** Purpose:
864          **     Restarts the Lexical Analyzer when the parse of an XWORD
865          **     token fails; allows the parser to find smaller keywords i
866          **     the same LEX file, as well as similarly spelled keywords
867          **     in other LEX files.
868          **
869          **     The RESTAR entry point is used by the parse error driver
870          **     to try all possible statement parses, before reporting an
871          **     error; the original parse error and position is saved and
872          **     is later restored if all subsequent parse attempts fail.
873          **
874          **     The REST* entry point is used by a LEX file when a parse
875          **     fails and it is known that RESTAR will find a subsequent
876          **     statement parse in the mainframe which can give a clearer
877          **     more coherent error message. This entry point ensures
878          **     that the caller's error number and error position is NOT
879          **     preserved anywhere - it is as though the keyword was neve
880          **     found.
881          **
882          ** Entry:
883          **     (STMTDO) = Input pointer for restart

903          **
904          **     REST* - (INADDR) = address of last stmt length byte
905          **         (S-R1-3)#F iff Extended IF
906          **
907          **
908          ** Exit:

```

```

909      **      Control is turned over to the main parse driver.
910      **
911      ** Calls:      RESPTR,RESCAN,R.STPR,STLXP2,SVRST2,EXTIF+
912      **
913      ** Uses.....
914      ** Exclusive: A,C,D1,DO,S8
915      ** Inclusive: A-C, D1,DO, S0-S3,S8,S11, R0,R3
916      **
917      ** Stk lvls:   3
918      **
919      ** Detail:
920      **      The component parts of RESTART are as follows:
921      **      S-R1-0 Original error#; set prior to 1st time
922      **                through RESTART
923      **      S-R1-1 Original error position; set prior to 1st
924      **                time through RESTART
925      **      S-R1-3 Flags the parse error handler whether or
926      **                not to RESTART the lexical analyzer.
927      **                If S-R1-3 is nonzero, STMTDO contains the
928      **                address at which to set D1 to restart and
929      **                S-R1-2 contains the restart address.
930      **                S-R1-3 is cleared when NTOKEN is first
931      **                called; It is set (along with STMTDO) when
932      **                the begin BASIC token is an XWORD.
933      **      S-R1-2 Contains RESTART address. Set initially
934      **                when NTOKEN first called. Updated when
935      **                RESCAN called in RESTART.
936      **      STMTDO Contains address at which D1 should be at
937      **                when restarting the lexical analyzer. Set
938      **                and cleared with S-R1-3.
939      **
940      ** Algorithm:
941      **      If 1st time thru RESTART for this lexeme
942      **      (S-R1-0 contains 0)
943      **      Save err# in S-R1-0 & position in S-R1-1;
944      **      Clear RESTART flag (S-R1-3);
945      **      Get input ptr from STMTDO & write out to LEXPTR
946      **      (needed 'cause RESCAN doesn't save as NTOKEN does);
947      **      Retrieve RESTART addr for lexical analyzer (S-R1-2);
948      **      Restore DO from INADDR;
949      **      Call RESCAN; Set RESTART flag (S-R1-3) if XWORD/XFN;
950      **      Save RESTART address in S-R1-2;
951      **      Goto H (main parse driver - JP&PR1).
952      **
953      ** History:
954      **
955      **      Date      Programmer      Modification
956      **      -----      -
957      **      07/06/82    JP              Modified documentation
958      **      08/23/82    S.W.           Added documentation on S-R1-2, S-R1-3
959      **                                and STMTDO.
960      **      11/15/82    S.W.           Deleted error exit option - wasn't
961      **                                used anywhere
962      **      05/24/83    S.W.           Added REST* entry point for use by
963      **                                language extensions; this is an alter

```

```

964      **           tive to the 'usual' error exit (the
965      **           usual error exit saves the original
966      **           error and restores it if no other par
967      **           works). REST* can be used ONLY if it
968      **           known that restart will eventually gi
969      **           control to a mainframe parse routine;
970      **           REST* can be useful to prevent obscur
971      **           error messages. If a previous parse
972      **           error occured, the first one generate
973      **           in the 'usual' way is preserved; othe
974      **           wise the next error generated in the
975      **           'usual' way (not using REST*) is
976      **           preserved.
977      **           For example:
978      **           The HPIL parse for ON INTR, may choo
979      **           to suppress its error message/positio
980      **           in favor of any one given by ON ERROR
981      **           TIMER|<expr>
982      **

1218          **              PRENCK, SPLVRP, RS-R03, OUTNIB
1219          **
1220          ** Uses:       A-C, S0-S3, S11, S7, S8, R0-R3
1221          **
1222          ** Stk Lvl: 4
1223          **
1224          ** Detail: TOKENIZED AS:
1225          ** tDEF<5 nib field>tFN tVAR [tSEMIC tCONSTANT tSEMIC]
1226          ** <1 nib parm ct.> [tPRMST <parm list>a)] [tCOMMA expression]
1227          **
1228          ** tSEMIC tCONSTANT connotes a string length declaration.
1229          ** tDEF is characterized as 'LEGAL AFTER THEN' & CALC
1230          ** BASIC. This allows 'DEF KEY' to be executable.
1231          ** However 'DEF FN' isn't 'LEGAL AFTER THEN' or
1232          ** CALC BASIC.
1233          **
1234          ** tFN signifies a single line function. In the case of a
1235          ** multiple line user defined function, this field will
1236          ** be a zero byte.
1237          **
1238          ** Because of the tokenization of the DEF FN statement,
1239          ** statement terminators can't have a low nibble of F.
1240          **

13         *****
14         **
15         ** Name:      PILP      - Channel Number, Record Number Parse
16         **
17         ** Category:   PARUTL
18         **
19         ** Purpose:    Parses Channel Number and Record Number
20         **
21         **             PILP entry parses both the channel number
22         **             and the optional record number. Channel
23         **             number must either be followed by a comma
24         **             and a record number, or it must be
25         **             immediately followed by a semi-colon; other-
26         **             wise an error exit is taken. If the channel
27         **             number is followed by a comma and a record
28         **             number, then this entry makes a distinction
29         **             as to whether or not the record number is
30         **             followed by a semi-colon - if it isn't this
31         **             routine assumes that statement parse is
32         **             complete (ie no parameter list) and returns
33         **             directly to the main parse driver. If it
34         **             is followed by a semi-colon, it returns to
35         **             the caller. This entry point is utilized
36         **             by both READ# and PRINT#.
37         **
38         **             PILP+ entry parses the channel number only.
39         **             It indicates an exit by use of a status bit
40         **             setting as to whether or not the channel
41         **             number was followed by a comma.
42         **
43         ** Entry:       2 entry points:
44         **               D(A) = (AVMEME)
45         **               D1 points to optional blanks preceding #
46         **               D0 points into output buffer
47         **               1) PILP - Caller must be on the same
48         **                   subroutine level as if they
49         **                   were called by the main parse
50         **                   driver.
51         **               2) PILP+ - S8=1
52         **
53         ** Exit:        Carry set =>
54         **               No '#' found
55         **               Carry clr =>

```

```

56      **      Found '#' and parsed channel#
57      **      P=0
58      **      PILP entry:
59      **      tSEMIC was last token found and output
60      **      (syntax was <channel#> [<record#>] ;
61      **      D1 past ascii ;
62      **      D0 past tSEMIC
63      **
64      **      PILP+ entry:
65      **      S8=1 => No comma after channel#
66      **      S8=0 => tCOMMA found and output
67      **
68      **      No rtn to caller (only to main parse driver) =>
69      **      (only for PILP entry)
70      **      Record number wasn't followed by a semi-colon
71      **
72      **      Error exits if neither ',' or ';' found after
73      **      channel number (PILP entry only)
74      **
75      ** Calls:   #CK, OUT1TK, NUMCK, RESPTR, COMCK+, NUMC+0
76      **
77      ** Uses:    A-C,D(15-5),S0-S3,S7,S8,S11,R0,R1,R3,FUNCDO
78      **
79      ** Stack lvls: 5
80      **
81      ** Detail:   For PILP entry, if there's no terminating semi-
82      **           colon after the record#, a level is popped off
83      **           the return stack before returning. This is
84      **           because it assumes the statement syntax is
85      **           complete.
86      **
87      **           Another assumption made by PILP entry is that
88      **           if there's no record number specified, there
89      **           had better be a variable or expression list
90      **           (which is always preceded by a semi-colon).
91      **
92      **           Acceptable syntax for commands calling PILP/PILP+
93      **
94      **           PRINT# uses same general syntax as READ#:
95      **           READ #<channel no.>; <vbl/expr list>
96      **           READ #<channel number>, <record number>
97      **           READ #<channel no.>, <record no.>; <vbl/expr list>
98      **
99      **           RESTORE #<channel number> [,<record number>]

251          STITLE IF Parse
252          *****
253          *****
254          **
255          ** Name:      IFP      - IF statement parse
256          ** Name:      ELSEP    - ELSE parse
257          **
258          ** Category:   STPARS
259          **
260          ** Purpose:    IFP entry parses the first part of an IF
261          **               construct (up through THEN). If THEN is
262          **               immediately followed by a line number or
263          **               a quoted label, the parse continues
264          **               through the implied GOTO. It also traps
265          **               out implied LET and transfers control to
266          **               the appropriate parse with S10 and S9 set,
267          **               flagging this as an implied LET in the
268          **               'middle' of an IF statement; this prevents
269          **               a failed implied LET parse from being re-
270          **               parsed as implied DISP - instead it will
271          **               be parsed as a label (implied GOTO).
272          **
273          **               ELSEP entry parses what immediately
274          **               follows the ELSE keyword. This is
275          **               analogous to what is said for THEN above.
276          **               This entry is used by the main parse
277          **               driver when it encounters the ELSE key-
278          **               word and it has been determined that it
279          **               is appropriate (S6=1)
280          **
281          ** Entry:       S6=0
282          **               D(A) = (AVMEME)
283          **               IFP entry:
284          **                 D1 is past IF
285          **                 D0 points into output buffer past tIF
286          **               ELSEP entry:
287          **                 D1 is past ELSE
288          **                 D0 points into output buffer past tTHEN (t@)
289          **
290          ** Exit:        P=0
291          **               S6=1 => ELSE is a legal stmt terminator
292          **
293          **               Returns to main driver with carry clr =>

312      **      This looks like an 'extended IF' but
313      **      it is not an implied LET; ie it looks
314      **      like THEN/ELSE is immediately followed
315      **      by a begin BASIC keyword.
316      **      S10=S9=1 (Don't try implied DISP if errors)
317      **      A = The token following THEN/ELSE
318      **      D1 is advanced past the corresponding text
319      **      tEXTIF (t@) has been output
320      **      DO is 4 nibbles beyond tEXTIF
321      **      (beyond statement length byte)
322      **
323      ** Calls:  NUMCK, WSRO-3, LBLNIF, WRDSCN, SVRSTA
324      **          eolck+, FINDA, R.STPR, STMTLO, UPDIN+
325      **
326      ** Uses:   A-C,D(15-5), D1,DO, R0,R1,R3, S0-S3,S6,S7,S9,
327      **          FUNCDO, S-R0-3, S-R1-0, S-R1-2, S-R1-3
328      **
329      ** Stk lvls: 6
330      **
331      ** Detail: 'IF' illegal after 'pending' THEN
332      **      S6 is the global flag that indicates whether
333      **      or not ELSE is a valid statement terminator.
334      **      It also indicates whether or not IF is a
335      **      legal construct in the current context:
336      **      S6=0 => IF is a legal construct
337      **                  ELSE is not a legal terminator
338      **                  Either we're not currently parsing
339      **                  within an IF construct OR
340      **                  We are, but it's after the ELSE.
341      **
342      **      S6=1 => IF is not a legal construct
343      **                  ELSE is a legal statement terminator
344      **                  We are parsing within an IF
345      **                  construct, but we are prior to ELSE.
346      **
347      ** Algorithm:
348      **
349      **      Set IF in progress flag (S-R0-3);
350      **      Parse numeric expression;
351      **      If not tTHEN
352      **          Error
353      **      Clear RESTART flag (S-R1-3); Clear Err# (S-R1-0);
354      **      Call NTOKEN; Set RESTART flag if XWORD/XFN;
355      **      Save RESTART address (S-R1-2);
356      **      Save contents of LEXPTR in STMTDO;
357      **
358      **      If variable (letter not associated with token)
359      **      or user-defined function name
360      **          Call EXTIFP;

```

```

361      **          Goto C2 (parse driver - see algorithm JP&PR1).
362      **
363      **          If single or double quote
364      **          Call LBLNIF;
365      **          If legal label
366      **          THEN return with carry clear
367      **          ELSE error
368      **          If line#
369      **          Call LBLINF; return with carry clear
370      **
371      **  EXTIFP:  Save token;
372      **          Set S9 (Middle of IF) & S10 (Implied LET)
373      **          (Needed so string functions & failed assignments
374      **          don't parse as implied DISP, but as labels)
375      **          Output tEXTIF (looks like @);
376      **          Calculate & write out stmt length in previous
377      **          INADDR; Update INADDR; Restore token;
378      **          Return with carry set

622          **
623          ** Purpose: REM entry parses the REM statement and comments
624          **              beginning with '!'. It does this by copying the
625          **              ascii characters in the input stream to the output
626          **              buffer until D0 (endline) is encountered.
627          **
628          **              REM10 is an entry point for decompile; it
629          **              decompiles DATA, REM and !, by copying the ascii
630          **              characters from the token stream to the output
631          **              buffer.
632          **
633          ** Entry:    D(A) = (AVMEME)
634          **              D0 points into output buffer
635          **              P=0
636          **              2 entry points:
637          **              1) REM    - D1 past REM keyword or '!'
638          **                      D0 past tREM or t!
639          **              2) REM10 - D1 past tREM, tDATA or t!
640          **                      D0 past REM/DATA keyword or '!',
641          **                      followed by ascii blank
642          **
643          ** Exit:
644          **              Carry clear
645          **              D1 at OD (Endline)
646          **              D0 points into output buffer
647          **
648          **              REM:      Ascii remark in output buffer
649          **                      D0 past output OD
650          **              REM10:    D0 past last ascii character
651          **

680          *****
681          *****
682          **
683          ** Name:      DATP      -   DATA Statement Parse
684          **
685          ** Category: STPARS
686          **
687          ** Purpose:   Parses DATA statement
688          **
689          ** Entry:     D(A) = (AVMEME)
690          **             D1 points past DATA keyword
691          **             D0 points into output buffer, past tDATA
692          **
693          ** Exit:      Valid parse=>
694          **             Return with carry clear
695          **             D1 points past syntactically correct statement
696          **             D0 points past tokenized statement
697          **             P=0
698          **
699          ** Calls:     DATACK (OUTLIT), BLNKCK, OUT1T+, CHK-OD
700          **
701          ** Uses:      A-C, D0,D1
702          **
703          ** Detail:    Quoted strings may be delimited by single or double
704          **             quotes, allowing any characters (except of course
705          **             the particular delimiting quote) to be quoted.
706          **
707          **             Unquoted strings allow any characters except commas.
708          **
709          **             Quoted strings which are followed by extraneous non-
710          **             blank characters before the comma or newline are
711          **             treated as unquoted strings (i.e. everything from
712          **             the preceding comma to the following comma or
713          **             newline is considered an unquoted string).
714          **
715          **             On unquoted strings, leading and trailing blanks are
716          **             truncated.
717          **
718          **             Due to the parse algorithm, unquoted strings which
719          **             contain a quote are considered to contain a quoted
720          **             string and so there must be a matching quote.
721          **
722          **             At execution:
723          **             DATA <newline> is interpreted as
724          **             DATA ""
725          **
726          **             and DATA <string>,   is interpreted as
727          **             DATA <string>,""
728          **             This is different from the HP-85
729          **
730          ** Stack lvls: 4
731          **
732          ** History:
733          **

1224          STITLE OUTLIT - Output Literal
1225          *****
1226          *****
1227          **
1228          ** Name:(S) OUTLIT - Output Delimited Literal
1229          ** Name:(S) OUTLI1 - Output Delimited Literal
1230          ** Name:   DATAK - Output Literal Delimited by Quotes
1231          **
1232          ** Category:  PARUTL
1233          **
1234          ** Purpose:
1235          **   OUTLIT and OUTLI1 entry points output a string of
1236          **   literals delimited by a specified delimiter (this
1237          **   delimiter may or may not be a quote). The only
1238          **   difference between these two entry points is that OUTLIT
1239          **   takes an error exit if no closing delimiter is found;
1240          **   OUTLI1 simply returns with the carry set in this case.
1241          **
1242          **   DATAK entry parses a string delimited by either single
1243          **   or double quotes. If no closing delimiter is found,
1244          **   DATAK takes an error exit.
1245          **
1246          ** Entry:
1247          **   D(A) = (AVMEME)
1248          **   D1 points into the input stream
1249          **   D0 points into the output buffer
1250          **   3 entry points:
1251          **   1) OUTLIT - D1 points at the delimiting character
1252          **                 A(B) contains the ascii delimiter
1253          **                 P=0
1254          **   2) DATAK - D1 points at optional blanks preceding
1255          **                 the alleged single or double quote.
1256          **   3) OUTLI1 - D1 points at 1st character after the
1257          **                 delimiter.
1258          **                 A(B) contains the ascii delimiter.
1259          **                 P=0
1260          **
1261          ** Exit:
1262          **   Carry clr =>
1263          **   D1 is advanced to the character following the
1264          **   closing delimiter.
1265          **   The literal up through the closing delimiter
1266          **   has been written to the output buffer.
1267          **   D0 points past the closing delimiter.
1268          **
1269          **   Carry set (OUTLI1 entry only) =>
1270          **   D1 is 2 nibbles past D0 (Endline)
1271          **   All characters, up to but not including D0,
1272          **   have been output
1273          **   D0 points past the characters which have been
1274          **   output
1275          **
1276          **   Else error exit (OUTLIT, DATAK only)
1277          **   w/ D1 at 0D - Error is : Quote Expected
1278          **

```

```

1936 *****
1937 **
1938 ** Name:    SUBNMP   - Subprogram Name Parse
1939 ** Name:    SBNMPO   - Checks for Start of Parameter List
1940 **
1941 ** Category: PARUTL
1942 **
1943 ** Purpose: Parses subprogram name and checks for start of a
1944 **           parameter list. It is used by SUB and CALL
1945 **           statement parse.
1946 **
1947 **           SUBNMP entry parses a subprogram name; it
1948 **           only allows it in the form of an unquoted string
1949 **           (Leading and trailing quotes can be checked for
1950 **           by the caller).
1951 **           Then it falls into the SBNMPO entry.
1952 **
1953 **           SBNMPO entry checks for the start of a parameter
1954 **           list, which is indicated by '('. If found, it
1955 **           outputs tPRMST and returns with carry clear;
1956 **           otherwise it returns with carry set.
1957 **
1958 ** Entry:    D(A) = (AVMEME)
1959 **           D1 points to input stream
1960 **           D0 points into output buffer
1961 **           2 entry points:
1962 **           1) SUBNMP - D1 at optional blanks preceding
1963 **                     the alleged subprogram name.
1964 **           2) SBNMPO - Tokenized subprogram name output,
1965 **                     with D0 positioned past it.
1966 **                     D1 past the subprogram name.
1967 **
1968 ** Exit:    P=0
1969 **           Carry set =>
1970 **           No parameter list
1971 **           SUBNMP entry:
1972 **              D1 pts to 1st non-blank char past subp. name
1973 **              D0 points past tokenized subprogram name
1974 **           SBNMPO entry:
1975 **              D1 preserved from entry (except advanced
1976 **              past leading blanks)
1977 **              D0 preserved from entry
1978 **
1979 **           Carry clr =>
1980 **           There should be a parameter list
1981 **           D1 past ascii (
1982 **           tPRMST output; D0 points past it
1983 **           C(B)=ascii ( ; A(B)=tPRMST
1984 **

```

```

3250          STITLE File Specification Parse
3251          *****
3252          *****
3253          **
3254          ** Name:(S) FSPECp - File Specification Parse
3255          ** Name:   FSPC10 - Outputs Literal File Name
3256          **
3257          ** Category:  PARUTL
3258          **
3259          ** Purpose:
3260          **   File Specfication Parse
3261          **
3262          **   FSPECp accepts string expressions as valid file
3263          **   specifiers. Quoted strings are considered string
3264          **   expressions.
3265          **
3266          **   Unquoted strings are carefully parsed to ensure they
3267          **   conform to the correct syntax. File names (if they're
3268          **   given) must start with a letter and, unless a poll
3269          **   handler responds, are limited to 8 characters.
3270          **   Remaining characters may be letters or digits.
3271          **   Parse includes any device specifiers that are given.
3272          **   If a device is included, a file name is optional.
3273          **
3274          **   If a valid file name is followed by '@' or by any
3275          **   char. not in the ascii range of '.' - 'z', the file
3276          **   specifier is considered to be terminated.
3277          **
3278          **   If a valid file name is followed by ':', FSPECp
3279          **   attempts to parse the device that should follow.
3280          **   If the device is not MAIN, PORT, CARD, or PCRD,
3281          **   a device poll is done.
3282          **
3283          **   If a valid file name is followed by any other
3284          **   character (this file names over 8 characters
3285          **   long), a poll is done.

3408      ** *****
3409      **
3410      ** Name:(S) pFSPCp - POLL for File Specifer Parse
3411      **
3412      ** Category: POLL
3413      **
3414      ** Type: POLL

```

```

3415      **
3416      ** Purpose:
3417      ** POLL for File Specification Parse.
3418      ** Unquoted string is not a legal mainframe file name.
3419      **
3420      ** Either:
3421      ** a) the 1st character isn't a letter or colon
3422      ** (device specifier starting with a character
3423      ** other than a colon)
3424      ** OR
3425      ** b) Valid file name is followed by a
3426      ** "non-terminating" character, ie one in the
3427      ** ASCII range of "." to "z" (with the exception
3428      ** of ":" and "@"). The character may be a part
3429      ** of the file name (as in a file name with more
3430      ** than 8 characters or a file name that starts
3431      ** with a letter, but contains a character other
3432      ** than a letter/digit) OR it may be a delimiter
3433      ** between the file name and the device specifier.
3434      **
3435      ** Should poll be "Handled" (return with XM=0)?:
3436      ** Yes - If File specifier is recognized
3437      **
3438      ** Meaning of "Handling" Poll (what does code do if handled?):
3439      ** Parse and tokenize file specification analogous to
3440      ** the mainframe tokenization:
3441      **
3442      ** Filename over 8 characters or a file name with a
3443      ** non letter/digit character embedded in it.
3444      ** tLITRL <ascii file name>
3445      ** Ex: ABC_X or ABCDEFGH
3446      **
3447      ** Filespec beginning with character other than a letter
3448      ** or a colon:
3449      ** tCOLON tLITRL <ascii file specifier>
3450      ** Ex: /WAND
3451      **
3452      ** In the first case above, if the valid file name is
3453      ** immediately followed by a 'non-terminating'
3454      ** character not recognized by the responder
3455      ** (letter in the ascii range '.' to 'z' not
3456      ** including letters/digits or '@'), a poll to pDEVCP
3457      ** may be appropriate.
3458      ** tLITRL <ascii file name> tCOLON tLITRL <ascii device>
3459      ** Ex: ABC_X.DISC or ABCDEFGHI/DISC
3460      **
3461      ** Entry conditions for handler (registers, ST, RAM, etc.):
3462      ** S4=S10=S7=0
3463      ** B[R] = Poll number (pFSPCp)
3464      ** HEX mode.
3465      ** P=0.
3466      ** D(R) = (RVMEME)
3467      ** D1 @ Start of File specification
3468      ** (D1 points past any preceding blanks)
3469      ** D0 @ Position in Output Buffer to begin output of

```

```

3470      **      File specification
3471      **      R3(5-9)=D1 @ start of file specification input
3472      **      R3(A) = D0 @ start of file specification output
3473      **
3474      ** Normal exit conditions from handler if handled (ST, RAM,
3475      ** registers, etc.):
3476      **      Carry clear
3477      **      P=0
3478      **      S4=S7=S10=0
3479      **      HEX mode.
3480      **      XM=0.
3481      **      File specification is accepted and output @ D0
3482      **      See NOTE below
3483      **      D0 past last token of file specification
3484      **      D1 past file specification in input buffer
3485      **      R3 intact from entry
3486      **
3487      ** Normal exit conditions from handler if not handled (ST, RAM,
3488      ** registers, etc.):
3489      **      Carry clear
3490      **      P=0
3491      **      HEX mode.
3492      **      S4=S7=S10=0
3493      **      XM=1.
3494      **      R3 intact from entry
3495      **
3496      ** Error exit conditions from handler (POLL only):
3497      **      P=0
3498      **      Carry set.
3499      **      HEX mode.
3500      **      S7=S10=0
3501      **      R3 intact from entry
3502      **
3503      ** Available subroutine levels: 6
3504      **      POLL handler is one level shallower than caller--
3505      **      FSPECp uses 5; therefore Handler can use 6
3506      **
3507      **
3508      ** What registers/RAM may be used if handled?:
3509      **      A-D, D0, D1
3510      **      R0,R1,R2,R4
3511      **      STMTD1, S-R0-0, S-R0-1, SCRATCH, all of function scratch
3512      **
3513      ** What registers/RAM may be used if not handled?:
3514      **      A-D, D0, D1
3515      **      R0,R1,R2,R4
3516      **      STMTD1, S-R0-0, S-R0-1, SCRATCH, all of function scratch
3517      **
3518      ** What registers/RAM may be used if error exit (POLL only)?:
3519      **      A-D, D0, D1
3520      **      R0,R1,R2,R4
3521      **      STMTD1, S-R0-0, S-R0-1, SCRATCH, all of function scratch
3522      **
3523      ** Special memory/pointer considerations (are pointers funny?):
3524      **      No.

```

```

3525      **
3526      ** Detail:
3527      **   If HPIL is plugged in, it will answer this poll.
3528      **   Therefore, any other LEX file answering this poll
3529      **   should use an analogous tokenization scheme for the file
3530      **   name/device specifier tokenization so that file specifier
3531      **   execution works properly.
3532      **
3533      **   To get control during execution, respond to pFILXQ. This
3534      **   is a poll that is NOT answered by HPIL. If this poll
3535      **   is not answered by another LEX file, another poll is sent
3536      **   out later which HPIL answers.
3537      **
3538      **   For more information on how HPIL tokenizes devices, see the
3539      **   Detail portion of the documentaion on pDEVCP.
3540      **
3541      ** Envisioned application(s):
3542      **   Handle external file specifiers
3543      **   A123456789
3544      **   A123456789/DISC
3545      **   A123.WAND
3546      **   AB_X.DISC
3547      **   /WAND
3548      **
3549      ** History:
3550      **
3551      **   Date      Programmer      Modification

3553      **   07/15/82    JP           Added documentation
3554      **   05/07/83    JP           Modified documentation
3555      **
3556      ****
3557      ****
3558      ****
3559      ****
3560      **
3561      ** Name:(S) pDEVCP - Poll for Device Specifier Parse
3562      **
3563      ** Category:  POLL
3564      **
3565      ** Type:      POLL
3566      **
3567      ** Purpose:
3568      **   POLL for unrecognized device specifier following ":".
3569      **   If a file name preceded the colon, it has already been
3570      **   written to the output buffer.
3571      **
3572      ** Should poll be "Handled" (return with XM=0)?:
3573      **   Yes if Device specifier is recognized by handler.
3574      **
3575      ** Meaning of "Handling" Poll (what does code do if handled?):
3576      **   Parse and output tokenized form of device specifier
3577      **
3578      **   See detail below
3579      **

```

```

3580      ** Entry conditions for handler (registers, ST, RAM, etc.):
3581      **      B[A] = Poll number (pDEVCP)
3582      **      HEX mode.
3583      **      P=0.
3584      **      S4=S7=S10=0
3585      **      D1 past colon in file specification
3586      **      If a filename was specified, its tokenization was
3587      **      written to the output buffer & D0 points past the
3588      **      last character of the filename
3589      **      D(A) = (AVMEME)
3590      **      R3(A) = D0 @ start of tokenized filespec in output
3591      **      buffer
3592      **      R3(9-5) = D1 @ start of file spec in input buffer
3593      **
3594      ** Normal exit conditions from handler if handled (ST, RAM,
3595      ** registers, etc.):
3596      **      Carry clear
3597      **      S4=S7=S10=0
3598      **      P=0
3599      **      HEX mode.
3600      **      XM=0.
3601      **      Tokenized device written to output buffer
3602      **      D0 points past the tokenization
3603      **      D1 is past the corresponding text in the input buffer
3604      **      R3 preserved from entry
3605      **
3606      ** Normal exit conditions from handler if not handled (ST, RAM,
3607      ** registers, etc.):
3608      **      Carry clear
3609      **      S4=S7=S10=0
3610      **      P=0
3611      **      HEX mode.
3612      **      XM=1.
3613      **      Tokenized device specifier written to output buffer
3614      **      D0 points past tokenization
3615      **      D1 points past device specifier in input buffer
3616      **      R3 preserved from entry
3617      **
3618      ** Error exit conditions from handler (POLL only):
3619      **      Carry set.
3620      **      HEX mode.
3621      **      P=0
3622      **      S10=0
3623      **      R3 preserved from entry
3624      **
3625      ** Available subroutine levels: 6
3626      **      FSPECp used 5 levels
3627      **
3628      ** NOTE:
3629      **      If HPIL is plugged in, it responds to this poll;
3630      **      it accepts ALL device specifiers following the colon.
3631      **      Therefore, all LEX files should tokenize device
3632      **      specifiers in the same manner so that during execution
3633      **      the filespec execution routines work properly.
3634      **

```

```

3635      ** Respond to pFILXQ to gain control at execution. HPIL
3636      ** does not respond to pFILXQ.
3637      **
3638      **
3639      ** Detail:
3640      ** HPIL tokenizes devices as follows:
3641      **
3642      ** device word: (:TAPE)
3643      ** tCOLON tLITRL <ascii device word>
3644      **
3645      ** accessory ID: (:X32)
3646      ** tCOLON tX <expr> [ tCOLON <expr> ] [ tSEMIC <expr> ]

4250          STITLE File Name, Label Parse
4251          *****
4252          *****
4253          **
4254          ** Name:(S) FILEP - File Name Parse
4255          ** Name:(S) LABELP - Label Reference Parse
4256          ** Name:(S) FILEP1 - Literal File Name Parse
4257          ** Name:(S) FILEP- - Subprogram Name Parse
4258          ** Name:(S) FILEP+ - Label Declaration Parse
4259          ** Name:(S) FILEP! - Literal File Name Parse
4260          **
4261          ** Category: PARUTL
4262          **
4263          ** Purpose: Parses a file name or a label.
4264          **           Depending on the entry point, it can allow
4265          **           string expressions and unquoted strings, or
4266          **           it can be limited to unquoted strings alone.
4267          **           However, only unquoted strings are checked
4268          **           for conformance to legal file name syntax, ie
4269          **           limited to 8 characters or less of letters
4270          **           and digits, starting with a letter.
4271          **
4272          **           FILEP and LABELP allow string expressions and
4273          **           unquoted strings. FILEP, however, checks an
4274          **           unquoted string to ensure it is not one of
4275          **           the reserved words (TO,ALL,KEYS,CARD,INTO).
4276          **           LABELP does not make this special check.
4277          **           These entry points are useful for file name
4278          **           and label reference; for example GOTO/GOSUB
4279          **           parse calls LABELP.
4280          **
4281          **           FILEP1, FILEP-, and FILEP+ are all useful
4282          **           entry points for parsing literals which must
4283          **           conform to file name standards; included in
4284          **           this category would be label declarations
4285          **           and subprogram names in SUB statements.
4286          **           These entry points do not check for file
4287          **           reserved words.
4288          **
4289          **           FILEP! is similar to FILEP+ above, except
4290          **           it can be set to allow less than eight
4291          **           characters.
4292          **
4293          ** Entry: D1 points at input stream
4294          **        6 ENTRY POINTS:
4295          **
4296          **        1) FILEP - D1 points to optional blanks
4297          **                   preceding file name.
4298          **                   D(A) = (AVMEME)
4299          **                   D0 points to output buffer
4300          **        2) LABELP - Same as FILEP, except S10 must be
4301          **                   set to ignore file reserve words.
4302          **        3) FILEP1 - (LEXPTR) = address to restore input
4303          **                   pointer to; points to possible blanks
4304          **                   preceding file name.

```

```

4305      **          4) FILEP- - D1 at optional blanks preceding file
4306      **                      name.
4307      **          5) FILEP+ - D1 pointing at first character in
4308      **                      the file name.
4309      **          6) FILEP! - C(S)=#characters to allow - 1.
4310      **
4311      ** Exit:

9      TITLE Expression Parser<831212.1206>
10 03FD5 ABS #03FD5
11 *****
12 *****
13 **
14 ** Name:(S) EXPPAR - Expression Parse
15 ** Name:(S) EXPPLS - Expression Parse for Left of Equal Sign
16 ** Name:(S) EXPP10 - Expr Parse (specify start of parse stk)
17 **
18 ** Category: PARUTL
19 **
20 ** Purpose:
21 ** Parse an expression and compile correct code for it
22 ** Also parses dummy array references
23 ** EXPPLS will stop parsing when a valid left-hand-side
24 ** has been found.
25 **
26 ** Entry:
27 ** D0 is pointer to output stream
28 ** D1 is pointer to input stream
29 ** EXPPLS requires LeftSd(S7) to be set on entry.
30 ** EXPP10 requires LeftSd(S7) to be clear on entry and
31 ** that D(A) be set to where the parse stack should
32 ** start.
33 **
34 ** Exit:
35 ** If dummy array found then
36 ** Carry set
37 ** S0 -- 1 (invalid expression)
38 ** S1 -- Set by last NTOKEN
39 ** S2 -- Set by last NTOKEN
40 ** S3 -- 1 (not valid string expression)
41 ** S7 -- Clear if EXPPAR, unchanged if EXPPLS
42 ** D0 -- Points past code compiled for dummy array
43 ** D1 -- Points past first token not used in expression
44 ** A -- Contains first token not used for dummy array
45 ** P -- 0
46 ** XM -- 0
47 **
48 ** else
49 ** Carry clear
50 ** S0 -- 0 if valid expression found, 1 otherwise
51 ** S1 -- Set by last NTOKEN
52 ** S2 -- Set by last NTOKEN
53 ** S3 -- 0 if valid string expr. found, 1 otherwise
54 ** S7 -- Clear if EXPPAR, unchanged if EXPPLS
55 ** D0 -- Points past code compiled for expression

```

```
56      **      D1 -- Points past first token not used in expression
57      **      ■ -- Contains first token not used in expression
58      **      XM -- Set iff expression is clearly a value expr
59      **      P -- 0
60      **      D(A) -- (MTHSTK)
61      **      (PRMCNT) set non-zero if expression contained user FN
62      **
63      ** Calls:      NTOKEN, OUT1TK, OUTNIB, OUTVAR, OUTLIT, OUTBYT,
64      **              RANGE, CMPBWC, SCAN, DELET1, DELET2, LOOK, LOOK2
65      **              GNXCRC, OUTNBS, PARMCK, BOPCOM, CONCOM, PUSH-P,
66      **              PUSH-3, INSRT1, RESPTR, CKLFSD
67      **
68      ** Uses:      A,B,C,D(15-5),R0,R1,S0,S1,S2,S3,S7,S11,Carry
69      **              FUNCDO,PRMCNT(first nib)
70      **
71      **
72      ** Stk lvls:   3
73      **
74      ** Detail:
75      **      Internal representation of non-terminals is:
76      **      00 -- Primary
77      **      01 -- S-expr
78      **      02 -- Factor
79      **      03 -- Term
80      **      04 -- Sum
81      **      05 -- Relation
82      **      06 -- Conjunction
83      **      07 -- Expression
84      **      08 -- N-func-ref
85      **      09 -- S-func-ref
86      **      0A -- Substring ref
87      **      0C -- StartR (Reference expression)
88      **      0D -- StartS (Reference expression w/substring)
89      **      0E -- StartV (Value expression)
90      **
91      **      This parser is essentially a stack automaton.
92      **      The stack builds from high memory down to lower
93      **      memory. All stack elements are 2 bytes (4 nibs)
94      **      in length although 2 or more elements may be used
95      **      to hold extra information if needed.
96      **
97      **      If EXPPLS is called with LeftSd set, the parser will
98      **      stop when it sees an reference expression or a
99      **      substring reference expression followed by an equals
100     **      sign.
101     **
102     **      Code is compiled from low memory toward high memory.
103     **      The code pointer and the stack pointer are checked
104     **      to make sure they never collide. MEMERR is called
105     **      if there is such a collision.
106     **
107     **      Value expressions are indicated upon return by the
108     **      XM bit. This is used to determine whether a parameter
109     **      in a CALL statement is a reference or value parameter.
110     **      It is also used to determine whether an expression
```

```
111      **      would be a valid destination address for an assignment
112      **      such as the INPUT statement.
113      **
114      ****
115      ****
```

```

116      EJECT
117      * The following is a loosely interpreted explanation
118      * of the stack automata that is implemented.
119      * To interpret it, states are identified by a symbol
120      * followed by a colon. Items on the stack are enclosed in
121      * angle brackets (< >). On the right side, a plus sign
122      * indicates that some code needs to be compiled. An asterisk
123      * on the right side indicates that the next token in the
124      * stream should be placed on top of the stack. If the stack
125      * is to be modified, the next line is used to show the
126      * way the stack should be changed to look; this is indicated
127      * by an arrow (-->). If no arrow is shown, then the stack is
128      * not modified before continuing.
129      * A symbol is shown on the far right
130      * that is the next state for the parser--think of this as a
131      * GO TO.
132      *
133      * Basically, the parser starts in state E0, which is the
134      * operand (expression) expected state. The stack is compared
135      * with the patterns shown (in the order shown) for a match.
136      * If the pattern matches, the parser modifies the stack as
137      * suggested by the table, compiles code (if necessary) and
138      * scans for another token and places it on stack (if
139      * necessary) and goes to the next state.
140      *
141      * The expression parser terminates with an error if it gets
142      * to the end of the patterns for a given state without
143      * matching. An error consists of getting to the ACCEPT
144      * state with the stack containing something other than
145      * a single numeric or string expression on top of the stack.
146      *

448          *****
449          *****
450          **
451          ** Name:(S) P1-10   -   Numeric Operand Found
452          **
453          ** Category:   PARUTL
454          **
455          ** Purpose:
456          **      Point of reentry for numeric funny functions
457          **
458          ** Entry:
459          **      P      = 0
460          **      DO    = Output ptr (points past last nib of FFN code)
461          **      D(R)  = Stack pointer
462          **      DI    = Input ptr (points past last char in FFN text,
463          **                  which is probably the closing paren)
464          **      If a funny function is re-entering here, it should
465          **      have set the XM bit to indicate that a value expression
466          **      has been parsed.
467          **
468          ** NOTE:
469          **      At this point a numeric operand has just been compiled.
470          **      Funny functions are a special type of function that
471          **      allow the expression parser to be extended to include
472          **      that have special parse and/or execution requirements.
473          **      See IDS for a complete description of how to implement
474          **      a funny function.

8      TITLE Lexical Analyzer <831212.1512>
9 048E6      ABS      #048E6
10     ****
11     ****
12     **
13     ** Name: (S) NTOKNL - Lex Analysis
14     ** Name: (S) NTOKEN - Lex Analysis
15     ** Name: (S) PRESCN - Lex Analysis
16     ** Name: (S) RESCAN - Lex Analysis
17     ** Name: (S) VRIABL - Lex Analysis
18     ** Name: SHFTKN - Lex Analysis
19     ** Name: (S) ALLDUN - Lex Analysis
20     ** Name: HOWARD - Lex Analysis
21     ** Name: (S) LEAVE - Lexical Analysis
22     **
23     ** Category: PARUTL
24     **
25     ** Purpose:
26     ** The lexical analyzer scans strings of ASCII characters
27     ** and associates unique numbers (tokens) with particular
28     ** substrings (lexemes). The tokens are used by language
29     ** parsing routines and interpreters.
30     **
31     ** Entry:
32     ** Many different entry points for different purposes.
33     **
34     ** NTOKNL - Looks for line number, or any other lexeme.
35     ** NTOKEN - Looks for any lexeme not a line number.
36     **
37     ** D1 is current input buffer position.
38     ** D0 is current output buffer position.
39     ** D(A) is end of output buffer.
40     **
41     ** PRESCN - Same as RESCAN, except output pointer is still
42     ** in D0, instead of C(A).
43     **
44     ** RESCAN - Looks for another token corresponding to a
45     ** lexeme.
46     **
47     ** IMPORTANT ENTRY POINT. There is where the
48     ** lexical analyzer can be restarted if an
49     ** undesired match occurred with an XWORD.
50     **
51     ** D1 is reset to start of lexeme to be
52     ** rescanned.
53     ** A(A) is Lexbuffer pointer returned for token
54     ** to be replaced.
55     ** C(A) is reset to start of token to be

```

```

56      **      replaced.
57      **      This is the output pointer, which will be in
58      **      DO upon exit. This pointer is not actually
59      **      used by this routine.
60      **      D(A) is end of output buffer.
61      **
62      **      VRIABL - Looks for Basic variable name.
63      **
64      **      D1 is current input buffer position.
65      **      RO is end of output buffer (done by previous
66      **      entry points).
67      **
68      **      SHFTKN - Places token in C(B) in front of tokens in A.
69      **
70      **      D1 is new input buffer position.
71      **      DO is lexbuffer pointer.
72      **      D(A) is execaddress, if there is one.
73      **      RO is end of output buffer.
74      **
75      **      ALLDUN - Restores output buffer pointer to DO.
76      **
77      **      D1 is new input buffer position.
78      **      DO is lexbuffer pointer.
79      **      D(A) is execaddress, if there is one.
80      **      RO is end of output buffer.
81      **
82      **      HOWARD - Restores output buffer pointer to DO.
83      **
84      **      D1 is new input buffer position.
85      **      C(A) is lexbuffer pointer.
86      **      D(A) is execaddress, if there is one.
87      **      RO is end of output buffer.
88      **
89      **      LEAVE - Restores end of output buffer to D(A).
90      **
91      **      D1 is new input buffer position.
92      **      DO is current output buffer position.
93      **      D(A) is end of output buffer.
94      **
95      **      Exit:
96      **      P=0.
97      **      D1 is new input pointer.
98      **      DO is current output pointer.
99      **      A contains token, up to 14 nibbles in length.
100     **      B[A] is execution address (if there is one).
101     **      B[X] is numeric constant exponent, if there is one.
102     **      C[S] is lexbuffer pointer used for RESCAN.
103     **      D[A] is end of output buffer.
104     **
105     **      Calls:      ARGCHK, BLDVAR, D=WORD, DGTSTR, GNXTCR, IOFND0,
106     **                  LDZERO, NUMSCN, Range, SCAN, STLXPT, STRCHK.
107     **
108     **      Uses.....
109     **                  A,B,C,P,DO,D1,RO,S0-S3,S11.
110     **

```

```
111      ** Stk lvls:  2
112      **
113      ** Detail:
114      **   The lexical analyzer consists of two parts: scanner
115      **   and lexicon.  The scanner is the code described here
116      **   with several entry points, one major subroutine
117      **   (NUMSCN) and many smaller subroutines.
118      **
119      **   The lexicon is a set of tables:
120      **
121      **   LXTYPT (lexical type table) is a table of character
122      **   categories, or types, which lives in system ROM.
123      **   This table helps the scanner reduce the time
124      **   selecting which scanning method to use:
125      **       Type 0 - Direct: Use transfer character in type
126      **                   table as token.
127      **       Type 1 - Word: Scan text table for string match.
128      **       Type 2 - Relational: Scan for relational operator.
129      **       Type 3 - Number: Call NUMSCN to format constant.
130      **
131      **   LEXBFR (lexfile buffer) is an I/O buffer in system
132      **   RAM which contains lextable IDs and maintable
133      **   addresses.
134      **
135      **   LXSPDT (speed table) is an optional table within
136      **   each lexfile which tells where in text table lexemes
137      **   with a particular first character begin.
138      **
139      **   LXTXIT (text table) is a table in every lexfile
140      **   containing the following text information:
141      **       Lexeme length - 1 nibble,
142      **       Lexeme text - 2-16 nibbles,
143      **       Lexeme token - 2 nibbles.
144      **
145      **   MAINT (main table) is a table in every lexfile which
146      **   contains token information:
147      **       Text offset - 3 nibbles.
148      **                   Locates text in text table; used in
149      **                   decompiling.
150      **       Execaddress - 5 nibbles.
151      **                   Self-relative pointer to token's
152      **                   execution address.
153      **       Characterization - 1 nibble.
154      **                   Syntactic class and spacing
155      **                   information.
156      **

26      ** Entry:
27      ** P=0
28      ** D1 @ BEGINNING OF COMPILED LINE IN RAM.
29      **
30      ** LDCOMP: 1) Updates current line
31      **          2) Clears SST flag
32      **          3) Decompiles entire BASIC line
33      ** LDCM10: Does 2 & 3 above
34      ** LDCEXT: Same as LDCM10, EXCEPT that this is
35      **          used to 'externally invoke' decompile.
36      **          Any memerr will return control to caller
37      **          with carry set.
38      ** sSSTdc=1 => only decompiles 1 stnt at a time
39      ** LDSST1: SST entry for Decompile w/ Line#
40      **          Assumes sSSTdc (S1) set appropriately
41      ** LDSST2 : SST entry for Multi-stnt Line
42      **          Assumes sSSTdc (S1) set appropriately
43      **
44      ** Exit:
45      ** Normal entry:
46      ** Carry Clear (through LSTLEN exit)
47      ** Decompiled Line sent to Input/Output Buffer
48      ** R0 past tEOL
49      ** If LDSST1/LDSST2 entry
50      ** D1 @ Tokenized Statement Terminator
51      ** B(A) = BUFFER LENGTH (#CHARACTERS)
52      ** Output Buffer collapsed --> AVMEMS <-- OUTBS
53      **
54      ** If LDCEXT entry is used:
55      ** Carry clear => normal exit

```

```

56      **          DO past ascii stream
57      **          OUTBS is start of ascii stream
58      **          A(A) past tEOL of line decompiled
59      **          Carry set => Menerr
60      **
61      ** Calls:      RTNSET, SAVELN, LDCSET, LINWDC, GTXT+1, AD1+2,
62      **              'DC (OUTBYT), ASCICK, ITEST, GTEXTI, OUTNBC
63      **              LINWAI
64      **
65      ** Uses.....
66      ** Exclusive: A-D, D1,DO, S0,S3,S5,S6,S7,S8,sSSTdc (S1)
67      ** Inclusive: A-D, D1,DO, S0,S3,S5,S6,S7,S8,S1, R0-R2,
68      **              S-R0-2 & flRTN (if LDCEXT entry used)
69      **
70      **          sSSTdc = SST Decompile - GLOBAL throughout decompile
71      **          S6 (VARDC),S8,CURRL
72      **
73      **          R0 = Pointer past tEOL (provided LDCEXT not used)
74      **          R1 = Preserved D1
75      **          R2 = Main Table Address
76      **          R3 cannot be used, it is used by "LIST"
77      **
78      **          SAVES NEW LINE# INTO CURRL (UPDATES CURRENT LINE)
79      **          CLEARS S8 FOR ALL BEGIN BASIC DECOMPILE STATEMENTS:
80      **          (CURRENTLY USED BY LISTDC & USER/BEEPDC)
81      **
82      ** Stk lvls:   6
83      **
84      ** Note:
85      **
86      **          No single Decompile routine can used more then 6 lvls
87      **          EXPRDC uses 4 subroutine levels
88      **
89      **          sSSTdc (S1) must not be used by individual Decompile
90      **          routines
91      **
92      **          Any decompile routine that POLLS must set AVMEMS at
93      **          the Current DO (call AVS=DO). This prevents the Poll
94      **          Save area from overwriting the Output Buffer.
95      **          Decompile, on exit, will set AVMEMS back @ OUTBS.

110     ** Name:(S) RELJMP - Relative Jump From (D1)

```

```

111      **
112      ** Category:  GENUTL
113      **
114      ** Purpose:
115      **      RELJMP reads the address pointed to by D1, adds it to
116      **      D1, then does a direct jump to the resulting address.
117      **
118      **      The mainframe uses RELJMP to jump to a decompile
119      **      routine.
120      **
121      ** Entry:
122      **      D1 points to relative address
123      **
124      ** Exit:
125      **      D1 = R1 on entry
126      **      A(5-0) = 6 nibbles pointed to by D1
127      **      C=A
128      **      PC is at resulting address
129      **
130      ** Calls:      none
131      **
132      ** Uses:      A,C,D1
133      **
134      ** Stk lvls:  0
135      **
136      ** Detail:
137      **      When the mainframe uses RELJMP to decompile a
138      **      statement, on entry D1 points to the decompile address
139      **      and R1 contains the pointer into the token stream, ie
140      **      R1 points past the begin BASIC token. So on exit from
141      **      RELJMP (upon entry to the decompile routine), D1 points
142      **      past the begin BASIC token and A contains the first six
143      **      tokenized nibbles that follow.
144      **
145      ** History:
146      **
147      **      Date      Programmer      Modification
148      **      -----      -
149      **      11/08/83   S.W.          Added documentation header

642                               STITLE ASCICK - Output ASCII chars
643 *****
644 *****
645 **
646 ** Name:(S) ASCICK - Ascii Stream Decompiler
647 ** Name:   ASCO2 - Ascii Stream Decompiler
648 **
649 ** Category:   DCMUTL
650 **
651 ** Purpose:    Outputs stream of ascii characters
652 **
653 ** Entry:      3 ENTRY POINTS :
654 **              DO points to where output to go
655 **              D(A) contains end of available memory (AVMEME)
656 **              1) ASCII+ - D1 at 2 nibs prior to alleged start
657 **                      of stream.
658 **              2) ASCICK - D1 at start of alleged ascii stream.
659 **              3) ASCO2 - Same as (2) above, only 1st character
660 **                      already known to be ascii & is in C(B)
661 **
662 ** Exit:       Carry clr
663 **              D1 past the ascii stream
664 **              C(B) contains 'terminating' 1-byte token
665 **
666 ** Calls:      OUTBYT
667 **
668 ** Uses:       A(B), C(B), D1, DO
669 **
670 ** Detail:     If there's no ascii characters, nothing will be
671 **              output & D1 will be left at 1st token
672 **              Interprets as ascii any 1 byte token in which
673 **              bit 7 is clear.

```

```
2712      **
2713      ** Type:          POLL
2714      **
2715      ** Purpose:
2716      **     Polls for handler for device decompile
2717      **
2718      ** Should poll be "Handled" (return with XM=0)?:
2719      **     Yes
2720      **
2721      ** Meaning of "Handling" Poll (what does code do if handled?):
2722      **     Decompiled device specifier output & DO updated.
2723      **
2724      ** Entry conditions for handler (registers, ST, RAM, etc.):
2725      **     Carry clear
2726      **     B[A] = Poll number.
2727      **     HEX mode.
2728      **     P=0.
2729      **     D1 at tCOLON
2730      **     A(B) contains tCOLON
2731      **     DO past last decompiled character
2732      **     D(A) contains the end of available memory
2733      **
2734      ** Normal exit conditions from handler if handled (ST, RAM,
2735      ** registers, etc.):
2736      **     P=0
2737      **     Carry clear
2738      **     HEX mode.
2739      **     XM=0.
2740      **     D1 past the file/device specifier
2741      **     File specifier output & DO updated
2742      **     D(A) preserved
2743      **
2744      ** Normal exit conditions from handler if not handled (ST, RAM,
2745      ** registers, etc.):
2746      **     P=0
2747      **     Carry clear
2748      **     HEX mode.
2749      **     XM=1.
2750      **
2751      ** Error exit conditions from handler:
2752      **     (Only happens with insufficient memory)
2753      **     P=0
2754      **     Carry set.
2755      **     HEX mode.
2756      **
2757      ** Available subroutine levels:
2758      **     6
2759      **
2760      ** NOTE:
2761      **     When D(A) is passed to the poll handler, it reflects what
2762      **     the end of available memory WILL be once we get to the
2763      **     handler.
2764      **
2765      ** What registers/RAM may be used if handled?:
2766      **     A-D, DO, D1, P always available
```

```

2767      **      S8,S9
2768      **      +Anything EXPRDC uses (R0,R1,R2,S0,S3,S10,S11)
2769      **
2770      ** What registers/RAM may be used if not handled?:
2771      **      A-D, D0, D1, P
2772      **      Same as if handled (see above)
2773      **
2774      ** What registers/RAM may be used if error exit:
2775      **      A-D, D0, D1, P
2776      **      Same as if handled (see above)
2777      **
2778      ** Special memory/pointer considerations (are pointers funny?):
2779      **      No
2780      **
2781      ** Envisioned application(s):
2782      **      Decompile non-mainframe device

9      TITLE Expression Decompile <831212.1206>
10 05922 ABS #5922
11      *****
12      *****
13      **
14      ** Name:(S) EXPRDC - Expression Decompile
15      ** Name:(S) EXDCLP - Funny function decompile reentry point
16      **
17      ** Category: DCMUTL
18      **
19      ** Purpose:
20      ** EXPRDC: Decompile expression lists
21      ** EXDCLP: This is the point where funny function
22      ** decompile routines should reenter the expression
23      ** decompiler.
24      **
25      ** Entry:
26      ** EXPRDC:
27      ** DO=Output stream pointer
28      ** D1=Input stream pointer
29      ** D(A)=End of avail mem pointer
30      ** A(B)=Contents of MEM(D1)
31      ** P=0
32      ** EXDCLP:
33      ** D1 is current input pointer(past FFN tokenization)
34      ** DO is current output pointer(past FFN text)
35      **
36      ** Exit:
37      ** DO=Updated output pointer
38      ** D1=Updated input pointer(First unused byte)
39      ** A(B)=First unused token
40      ** Carry clear
41      ** P = 0
42      **
43      ** Calls: VARDC,MOVEDO,RANGE,DRANGE,OUT1TK,OUTNBC,MEMERR
44      **
45      ** Uses.....
46      ** Inclusive: A,B,C,R0,R1,R2,S0,S3,S8,S10,S11,DO,D1
47      **
48      ** Stk lvls: 4
49      **
50      ** Detail:
51      ** R0 = Output pointer @ entry
52      ** R1 = Temporary input pointer, Sign holds text len
53      ** R2 = Function text
54      **
55      ** Explanation of terms used:

```

```
56      **      Nullop -- This a 00 byte which is used to preserve
57      **      a spot in the output stream to insert an
58      **      operator later. It also is used as a marker
59      **      to help find the spot later.
60      **      Denature -- Once operators have been enclosed in
61      **      parentheses or in a function call, the
62      **      of that operator is no longer of any
63      **      consequence to the rest of the expression.
64      **      To prevent operators so enclosed from affecting
65      **      precedence, they are changed (denatured) in
66      **      such a way that they do not look like operators
67      **      but can be recognized later when the time comes
68      **      to expand the operator token into the text
69      **      that corresponds to the token.
70      **
71      **      The expression decompiler keeps track of
72      **      whether the expression has the form of a
73      **      reference expression. To do this, it uses two
74      **      status bits, NewVal and OldVal. Each pass
75      **      through the decompile loop, the NewVal flag
76      **      is copied to the OldVal flag, and the NewVal
77      **      flag set, then if the token being decompiled
78      **      is a variable or an array token, the NewVal
79      **      flag is cleared. When the loop finally hits
80      **      a token which terminates the expression, the
81      **      OldVal flag will be clear only if the last
82      **      token in the expression is not a variable or an
83      **      array. This is equivalent to whether the
84      **      expression has the form of a value expression.
85      **      If the token that terminated the expression
86      **      was a call by value token and the OldVal flag
87      **      was left clear, then an extra set of parenthesis
88      **      is placed around the entire expression. This
89      **      feature is used in SUB decompile.
90      **
91      **      Algorithm:
92      **      Expression decompile converts an RPN string of
93      **      operands, operators and functions to an algebraic
94      **      stream of characters. The RPN stream is examined
95      **      an item at a time starting at the beginning (lowest
96      **      address). There are several types of items which
97      **      may be encountered in the stream. The following
98      **      summarizes what happens for each type:
99      **      Operands -- output a nullop followed by text for
100     **      constant
101     **      Single digit constants
102     **      Integer constants (2-12 digits)
103     **      Floating point constants (1-12 digits)
104     **      String constants (single or double quoted strings)
105     **      Alpha variables
106     **      Alpha-digit variables
107     **      String alpha variables
108     **      String alpha-digit variables
109     **      Monadic operators -- search back for a nullop,
110     **      insert operator token just after nullop,
```

```
111      **      insert parentheses around that area if an
112      **      operator of lower precedence is there.  If
113      **      parentheses were inserted then denature any
114      **      operators enclosed therein.
115      **      Unary minus
116      **      NOT
117      **      Dyadic operators -- search back for a nullop,
118      **      replace this nullop with the operator token,
119      **      insert parentheses around that area if an
120      **      operator of equal or lower precedence is there.
121      **      If parentheses were inserted then denature any
122      **      operator enclosed therein.
123      **      Now search back for another nullop, insert
124      **      parentheses if any operator of lower precedence
125      **      was encountered and denature all operators
126      **      within these parentheses.
127      **      ^
128      **      *
129      **      /
130      **      %
131      **      DIV
132      **      +
133      **      &
134      **      Relops
135      **      AND
136      **      OR
137      **      Functions -- Determine number of parameters.
138      **      If the function has no parameters then treat
139      **      it like an operand.  If it has more than one
140      **      parameter then for each "extra" parameter look
141      **      back for a nullop and replace it with a comma.
142      **      Now search for a nullop and insert the function
143      **      name and a left parenthesis just after it and
144      **      denature all operators between it and the
145      **      end of the output where a closing parenthesis
146      **      is appended.
147      **      Funny Functions -- Output a nullop and the text
148      **      for the function name then call the functions
149      **      "decompile" routine.
150      **      LPRP token -- Output a left and right parenthesis.
151      **
152      **
153      **      When any token other than one of the above is
154      **      encountered, that marks the end of the expression.
155      **      The entire output stream is moved from the beginning
156      **      of available memory to the end of available memory.
157      **      Now the copy back process begins.  The first byte
158      **      of the output stream should be a nullop and is
159      **      ignored.  Each remaining byte in the output
160      **      stream is copied back to the beginning of available
161      **      memory except that operators (and denatured operators)
162      **      are expanded to their full text representation and
163      **      any embedded nullops are converted to commas.
164      **      When a single or double quote is encountered, bytes
165      **      are copied verbatim until the corresponding closing
```

9      *      TITLE ROM 1 Fix Module
10 06250      ABS #6250
11      *
12      * The following code fixes bug #39-957(1)
13      * The "array required" attribute when used causes the minimum
14      * number of parameters check to be bypassed. This code replaces
15      * the check for the closing parenthesis which had been in-line
16      * in the expression parser code as well as adding a check for
17      * the minimum number of parameters. The first two instructions
18      * of this code along with the GOC DUMAER following the call to it
19      * replace the LCASC \)\ and ?ANC B \ GOYES DUMAER which were
20      * removed from the expression parser code. The net code change
21      * in the expression parser module is zero. The code added to thi
22      * module requires 41 nibbles.
23      *
24      * This subroutine returns with carry set if the dummy array isn't
25      * followed by a closing paren or if the minimum number of paramet
26      * have not been specified. The carry will be clear otherwise.
27 06250 3192 =DUMA80 LCASC \)\      Right paren required
28 06254 966      ?ANC B      Is the next char a right paren?
29 06257 00      RTNYES      No, then return with carry set

69          **

```

```
70      ** Category:   POLL
71      **
72      ** Type:       POLL
73      **
74      ** Purpose:
75      **     Handles CAT for files not in MAIN, plug-in memory,
76      **     Independent RAM, or CARD
77      **
78      ** Should poll be "Handled" (return with XM=0)?:
79      **     Yes
80      **
81      ** Meaning of "Handling" Poll (what does code do if handled?):
82      **     Takes over command; exits ready to go to next statement
83      **
84      ** Entry conditions for handler (registers, ST, RAM, etc.):
85      **     Carry clear
86      **     B[A] = Poll number.
87      **     HEX mode.
88      **     P=0.
89      **     File name (if any) in A(W) & R0
90      **     If no file name, then A(W)=0
91      **     Device Specifier in D(S),D(X)
92      **
93      ** Normal exit conditions from handler if handled (ST, RAM,
94      ** registers, etc.):
95      **     Carry clear
96      **     HEX mode.
97      **     XM=0.
98      **     PCADDR intact
99      **
100     ** Normal exit conditions from handler if not handled (ST, RAM,
101     ** registers, etc.):
102     **     Carry clear
103     **     HEX mode.
104     **     XM=1.
105     **
106     ** Error exit conditions from handler
107     **     Carry set.
108     **     HEX mode.
109     **     C[0-3] = Error number.
110     **
111     ** Available subroutine levels:
112     **     7
113     **
114     ** NOTE:
115     **
116     **     --SNAPBF, TRFMBF, LDCSPC
117     **     --LEXPTR.--
118     **
119     ** What registers/RAM may be used if handled?:
120     **     A-D, D0, D1, P
121     **     R0-R4, All of STMT/FN Scratch
122     **     Anything is available which is normally available to
123     **     statements.
124     **     S0-S11
```

```

125      **
126      ** What registers/RAM may be used if not handled?:
127      **      Same as if handled, except can't use R0 (see above)
128      **
129      ** What registers/RAM may be used if error exit
130      **      R-D, D0, D1, P
131      **      Same as if handled (See above)
132      **
133      ** Special memory/pointer considerations (are pointers funny?):
134      **      None
135      **
136      ** Envisioned application(s):
137      **      CAT on TAPE, etc
138      **
139      ** Note:
140      **      If no one responds to POLL, error given is eFSPEC.
141      **
142      **      See pCAT$ for related poll
143      **
144      ** History:
145      **
146      **      Date      Programmer      Modification

514      **
515      ** Name:(S) pCAT$ - Poll for CAT$ on external device

```

```
516      **
517      ** Category:   POLL
518      **
519      ** Type:       POLL
520      **
521      ** Purpose:
522      **     Creates buffer to execute CAT$ for external device
523      **     (related to pCAT)
524      **
525      ** Should poll be "Handled" (return with XM=0)?:
526      **     Yes
527      **
528      ** Meaning of "Handling" Poll (what does code do if handled?):
529      **     Pushes string on stack; AVMEME points to string header
530      **
531      ** Entry conditions for handler (registers, ST, RAM, etc.):
532      **     Carry clear
533      **     B[A] = Poll number.
534      **     HEX mode.
535      **     P=0.
536      **     SO set
537      **     AVMEME points to string header on stack (string contains
538      **     device name)
539      **     If the string is not null, it has already been reversed
540      **     via REV$ (Characters in mem in ascending order)
541      **     PC (DO) saved in F-R0-0
542      **
543      ** Normal exit conditions from handler if handled (ST, RAM,
544      ** registers, etc.):
545      **     Carry clear
546      **     HEX mode.
547      **     XM=0.
548      **     String on stack, with AVMEME pointing to string header
549      **     F-R0-0 preserved from entry
550      **
551      ** Normal exit conditions from handler if not handled (ST, RAM,
552      ** registers, etc.):
553      **     Carry clear
554      **     HEX mode.
555      **     XM=1.
556      **
557      ** Error exit conditions from handler:
558      **     Carry set.
559      **     HEX mode.
560      **     C[0-3] = Error number.
561      **
562      ** Available subroutine levels:
563      **     5
564      **
565      ** NOTE:
566      **     If poll not handled, eFSPEC generated
567      **
568      **     --SCRATCH, SNAPBF, TRFMBF, LDCSPC,--
569      **     --LEXPTR.--
570      **
```

```

571      ** What registers/RAM may be used if handled?:
572      **      A-D, D0, D1, P
573      **      R0-R4, S7-S11, FN Scratch except F-R0-0
574      **
575      ** What registers/RAM may be used if not handled?:
576      **      A-D, D0, D1, P
577      **      Same as if handled (see above)
578      **
579      ** What registers/RAM may be used if error exit
580      **      A-D, D0, D1, P
581      **      Same as if handled (see above)
582      **
583      ** Special memory/pointer considerations (are pointers funny?):
584      **      No
585      **
586      ** Envisioned application(s):
587      **      To handle: CAT$(n,":TAPE")
588      **
589      ** History:
590      **
591      **      Date      Programmer      Modification
592      **      -----
593      **      06/17/82   S.W.      Improved documentation
594      **      07/07/82   S.W.      Modified code before calling BF2STK
595      **      **      to reference AVMEME instead of TFORN
596      **      07/19/82   S.W.      Push null string on stack when
597      **      **      positive numeric argument too large
598      **      **      -- used to error.
599      **      10/20/82   S.W.      Replaced call to DDOSET (DO<=AVMEMS)
600      **      **      with call to LDCSET (DO<=OUTBS)
601      **
602      **      12/06/82   S.W.      Changed exit conditions for
603      **      **      CAT poll as per N. Zelle
604      **
605      **      12/13/82   S.W.      Polls on unrecognized file spec
606      **      **      Polls on file name (may be device
607      **      **      name without preceding colon)

1380 *****
1381 *****
1382 **
1383 ** Name:(S) pLIST - Poll for LIST on an external device
1384 **
1385 ** Category: POLL
1386 **
1387 ** Type: POLL
1388 **
1389 ** Purpose:
1390 **     LISTS a file on an external device
1391 **
1392 ** Should poll be "Handled" (return with XM=0)?:
1393 **     Yes
1394 **
1395 ** Meaning of "Handling" Poll (what does code do if handled?):
1396 **     Checks protection
1397 **     If file not PRIVATE, LISTS the file, ready to go on to
1398 **     NXTSTM
1399 **
1400 ** Entry conditions for handler (registers, ST, RAM, etc.):
1401 **     B[A] = Poll number.
1402 **     HEX mode.
1403 **     P=0.
1404 **     Blank-filed file name in A(W); R0 contains chars 9 & 10
1405 **     If no file name specified, A=0
1406 **     D(S) contains device id; D(X) contains device address
1407 **
1408 ** Normal exit conditions from handler if handled (ST, RAM,
1409 ** registers, etc.):
1410 **     Carry clear
1411 **     HEX mode.
1412 **     XM=0.
1413 **     PCADDR intact
1414 **
1415 ** Normal exit conditions from handler if not handled (ST, RAM,
1416 ** registers, etc.):
1417 **     Carry clear
1418 **     HEX mode.
1419 **     XM=1.
1420 **
1421 ** Error exit conditions from handler
1422 **     Carry set.
1423 **     HEX mode.
1424 **     C[0-3] = Error number.
1425 **
1426 ** Available subroutine levels:
1427 **     7
1428 **
1429 ** NOTE:
1430 **     For no file name specified, the default error message
1431 **     for 'not handled' will be eFSPEC.
```

```

1432      **
1433      ** What registers/RAM may be used if handled?:
1434      **      A-D, D0, D1, P

1463      **
1464      **
1465      ** Name:(S) pLIST2 - POLL to LIST non-BASIC/non-KEY file type
1466      **
1467      ** Category:  POLL
1468      **
1469      ** Type:      POLL
1470      **
1471      ** Purpose:
1472      **      POLLS to LIST a mainframe file that isn't BASIC or KEY
1473      **
1474      ** Should poll be "Handled" (return with XM=0)?:
1475      **      Yes
1476      **
1477      ** Meaning of "Handling" Poll (what does code do if handled?):
1478      **      LISTs the file on the display device
1479      **      Clears XM
1480      **      Ready to go to NXTSTM
1481      **
1482      ** Entry conditions for handler (registers, ST, RAM, etc.):
1483      **      B[A] = Poll number.
1484      **      HEX mode.
1485      **      P=0.
1486      **      D1 at file header start

```

```

1487      **      A(A) contains file type#
1488      **      DO past file specifier
1489      **
1490      ** Normal exit conditions from handler if handled (ST, RAM,
1491      ** registers, etc.):
1492      **      Carry clear
1493      **      HEX mode.
1494      **      XM=0.
1495      **      Ready to go on to NXTSTM - PCADDR intact
1496      **
1497      ** Normal exit conditions from handler if not handled (ST, RAM,
1498      ** registers, etc.):
1499      **      Carry clear
1500      **      HEX mode.
1501      **      XM=1.
1502      **
1503      ** Error exit conditions from handler
1504      **      Carry set.
1505      **      HEX mode.
1506      **      C[0-3] = Error number.
1507      **
1508      ** Available subroutine levels:
1509      **      7
1510      **
1511      **      STMT/FN Scratch, SCRTCH, SNAPBF, TRFMBF, LDCSPC,
1512      **      LEXPTR.
1513      **
1514      ** What registers/RAM may be used if handled?:
1515      **      A-D, DO, D1, P always available
1516      **      R0-R4, ST, scratch RAM
1517      **
1518      ** What registers/RAM may be used if not handled?:
1519      **      A-D, DO, D1, P always available
1520      **      R0-R4, ST, scratch RAM
1521      **
1522      ** What registers/RAM may be used if error exit (POLL only)?:
1523      **      A-D, DO, D1, P always available
1524      **      R0-R4, ST, scratch RAM
1525      **
1526      ** Envisioned application(s):
1527      **      LISTing files of types other than BASIC and KEY, eg
1528      **      perhaps TEXT or DATA files.
1529      **
1530      ** Default:
1531      **      If POLL not handled, error is Invalid File Type

2042      **
2043      ** Type:      POLL
2044      **
2045      ** Purpose:
2046      **      Polls to MERGE a non-mainframe file
2047      **
2048      ** Should poll be "Handled" (return with XM=0)?:
2049      **      Yes
2050      **
2051      ** Meaning of "Handling" Poll (what does code do if handled?):
2052      **      Merges designated file into current file (if BASIC),
2053      **      into keys file (if KEY), or other if some other file
2054      **      type and the command has been extended to allow this.
2055      **
2056      ** Entry conditions for handler (registers, ST, RAM, etc.):
2057      **      Carry clear
2058      **      B[A] = Poll number.
2059      **      HEX mode.
2060      **      P=0.
2061      **      A(W) contains first 8 characters of file name

```

```
2062      **      RO(3-0) contains characters 9 & 10
2063      **      DO past file specifier
2064      **
2065      ** Normal exit conditions from handler if handled (ST, RAM,
2066      ** registers, etc.):
2067      **      Carry clear
2068      **      HEX mode.
2069      **      XM=0.
2070      **      PCADDR intact, ready to go on to NXTSTM.
2071      **
2072      ** Normal exit conditions from handler if not handled (ST, RAM,
2073      ** registers, etc.):
2074      **      Carry clear
2075      **      HEX mode.
2076      **      XM=1.
2077      **      RO MUST be preserved from entry.
2078      **
2079      ** Error exit conditions from handler:
2080      **      Carry set.
2081      **      HEX mode.
2082      **      C[0-3] = Error number.
2083      **
2084      ** Available subroutine levels:
2085      **      7
2086      **
2087      ** NOTE:
2088      **      For no file name specified (MERGE :<device>)
2089      **      the default error message for 'not handled' will
2090      **      be eFSPEC.
2091      **
2092      ** What registers/RAM may be used if handled?:
2093      **      A-D, DO, D1, P
2094      **      RO-R4, all statuses except S13
2095      **      All of STMT and FN scratch

2125      ****
2126      ****
2127      **
2128      ** Name:(S) pMRGE2 - Polls to MERGE non-BASIC,non-KEY file
2129      **
2130      ** Category:  POLL
2131      **
2132      ** Type:      POLL
2133      **
2134      ** Purpose:
2135      **      Polls for handling of MERGE of non-BASIC,non-KEY
2136      **
2137      ** Should poll be "Handled" (return with XM=0)?:
2138      **      Yes
2139      **
2140      ** Meaning of "Handling" Poll (what does code do if handled?):
2141      **      Does appropriate MERGE, checking file protection, and
2142      **      memory requirements, exits ready to go on to NXTSTM.
2143      **
2144      ** Entry conditions for handler (registers, ST, RAM, etc.):
2145      **      Carry clear
2146      **      B[A] = Poll number.
2147      **      HEX mode.
2148      **      P=0.
2149      **      D1 at start of mainframe (source) file header
2150      **      A(A)=File type#
2151      **      D0 past file specifier
2152      **
2153      ** Normal exit conditions from handler if handled (ST, RAM,
2154      ** registers, etc.):
2155      **      Carry clear.
2156      **      HEX mode.
2157      **      XM=0.
2158      **      RFADJ has been called to update necessary pointers,etc
2159      **      Ready to go on to NXTSTM.
2160      **
2161      ** Normal exit conditions from handler if not handled (ST, RAM,
2162      ** registers, etc.):
2163      **      Carry clear
2164      **      HEX mode.
2165      **      XM=1.
2166      **
2167      ** Error exit conditions from handler (POLL only):
2168      **      Carry set.
2169      **      HEX mode.
2170      **      C[0-3] = Error number.
2171      **

```

```

2172      ** Available subroutine levels:
2173      **      7
2174      **
2175      ** NOTE:
2176      **
2177      **      --STMT/FN Scratch, SCRTCH, SNAPBF, TRFMBF, LDCSPC,--
2178      **      --LEXPTR.--
2179      **
2180      ** What registers/RAM may be used if handled?:
2181      **      A-D, D0, D1, P
2182      **      R0-R4, All statuses except S13
2183      **      All of STMT and FN scratch.
2184      **
2185      ** What registers/RAM may be used if not handled?:
2186      **      A-D, D0, D1, P
2187      **      R0-R4, All statuses except S13
2188      **      All of STMT and FN scratch.
2189      **
2190      ** What registers/RAM may be used if error exit (POLL only)?:
2191      **      A-D, D0, D1, P
2192      **      R0-R4, All statuses except S13
2193      **      All of STMT and FN scratch.
2194      **
2195      ** Envisioned application(s):
2196      **      Perhaps merging TEXT or LEX files.
2197      **      Could implement by using the EDIT poll to position
2198      **      at the file, thereby making it the current file.
2199      **

239      ****
240      ****
241      ****
242      **
243      ** Name:(S) pRUNft - Poll on RUN with unknown filetype
244      **
245      ** Category:   POLL
246      **
247      ** Type:       POLL
248      **
249      ** Purpose:
250      **     Poll on RUN with file of "unknown" filetype
251      **     Filetype is NOT BASIC or Binary
252      **
253      ** Should poll be "Handled" (return with XM=0)?:
254      **     No - this is a take-over Poll
255      **
256      ** Meaning of "Handling" Poll (what does code do if handled?):
257      **     Take over the RUN execution of the file
258      **
259      ** Entry conditions for handler (registers, ST, RAM, etc.):
260      **     B[A] = Poll number (pRUNft)
261      **     HEX mode.
262      **     P=0.
263      **     A(A) = File type (HEX)
264      **     R2(A)= File type (HEX)
265      **     D1 @ File length (offset) field in file header
266      **     5 nibble read @ D1 = Offset to next file
267      **     Current D1+ offset --> Next file start
268      **
269      **     CAT file length =
270      **     File offset value - Offset to data of file
271      **
272      **     sCONT = 1 if CONT           (S10)
273      **     sCONTK = 1 if CONT/RUN key  (S9)
274      **     sCHAIN = 1 if CHAIN statement (S11)
275      **

```

```

276      ** Normal exit conditions from handler if handled (ST, RAM,
277      ** registers, etc.):
278      **      Carry clear
279      **      HEX mode.
280      **      XM=0.
281      **      GOVLNG to MAIN05
282      **      or
283      **      GOVLNG to BSCEXT to exit the BASIC interpreter
284      **      This is done by BASIC and Binary programs
285      **      Filetype read, Buffers are flushed
286      **      A fast poll is issued: pBSCex
287      **
288      **      See NOTE below
289      **
290      **
291      ** Normal exit conditions from handler if not handled (ST, RAM,
292      ** registers, etc.):
293      **      Carry clear
294      **      HEX mode.
295      **      XM=1.
296      **      Preserve Status
297      **
298      ** Error exit conditions from handler
299      **      Error returns are ignored.
300      **      If the POLL returns:
301      **          If carry set ---> "eMEM" from POLL
302      **          else      ---> "eFTYPE" from RUN
303      **
304      ** Available subroutine levels: 7
305      **      --POLL handler is one level shallower than caller--
306      **      RUN is a top level statement/command
307      **
308      ** NOTE:
309      **      Any Lex File running a non BASIC file should:
310      **          Clear the SUSP annunciator
311      **          Set the PRGM annunciator      (see SFGPGM)
312      **          Collapse all BASIC stacks    (see CLPSTK)
313      **          Set CURRST, CURREN @ file    (see EDIT20)
314      **
315      **      Responder should issue a pRUNnB (RUN non BASIC) Poll
316      **      The mainframe issues a "pRUNnB" when
317      **      running a Binary file with the filetype in A(A)
318      **
319      ** What registers/RAM may be used if handled?:
320      **      --A-D, D0, D1, P always available--
321      **      RUN is in complete control at this point
322      **
323      ** What registers/RAM may be used if not handled?:
324      **      --A-D, D0, D1, P always available
325      **      Global status (S12-S15) are sacred
326      **
327      ** What registers/RAM may be used if error exit?:
328      **      No error exit allowed
329      **
330      ** Envisioned application(s):

```

```

331      **      Extend RUN statement to handle other file types

340      **      04/24/83   JP      Changed entry conditions
341      **
342      ****
343      ****
344      ****
345      ****
346      **
347      ** Name:(S) pRUNnB - Poll before non BASIC file exec (BIN)
348      **
349      ** Category:  POLL
350      **
351      ** Type:      POLL
352      **
353      ** Purpose:
354      **      Poll before starting execution or continuing execution
355      **      of a non BASIC file
356      **
357      **      Poll before running a BINARY file
358      **
359      **
360      ** Should poll be "Handled" (return with XM=0)?:
361      **      No - let this poll go to all other Lex files
362      **
363      ** Meaning of "Handling" Poll (what does code do if handled?):
364      **      Perform any "system" or special initialization needed
365      **      before Binary file is executed.
366      **
367      **
368      ** Entry conditions for handler (registers, ST, RAM, etc.):
369      **      B[A] = Poll number (pRUNnB)
370      **      HEX mode.
371      **      P=0.
372      **
373      **      R2(A)= File type of file to execute
374      **      DO @ Start of code to execute
375      **      BASIC stacks have been collapsed
376      **
377      **      General purpose poll
378      **
379      **      Mainframe poll will ALWAYS be Binary execute
380      **      R2(A)= fBIN
381      **      DO @ Start of binary file
382      **      If sCONT (S10) = 1
383      **      Executing a CONT statement
384      **      CNTADR is always zero, unless a Lex file has
385      **      set this (see pBSCex Poll)

```

```

386      **          Therefore, CONT is always a RUN
387      **          If sCONTK (S9) = 1
388      **          RUN or CONTK hit
389      **          If sCHAIN (S11)= 1
390      **          CHAIN statement
391      **          SUSP annunciator has been cleared
392      **          PRGM annunciator and PgmRun flag have been set
393      **          Current file pointers @ Binary file
394      **
395      ** Normal exit conditions from handler if handled
396      **
397      **          This poll should NOT be indicated as handled so
398      **          other Lex files can "set-up" before execution.
399      **
400      **          If Lex file wants to be the ONLY Lex file to handle:
401      **          then:
402      **
403      **          Carry clear
404      **          HEX mode.
405      **          XM=0.
406      **          DO must be PRESERVED!!!
407      **          Preserve S3
408      **
409      ** Normal exit conditions from handler if not handled
410      **
411      **          Carry clear
412      **          HEX mode.
413      **          XM=1.
414      **          Status intact: sCONT(10), sCONTK(S9), sCHAIN(S11),S3
415      **
416      ** Error exit conditions from handler:
417      **          Error return has no meaning ---
418      **
419      ** Available subroutine levels:
420      **          --POLL handler is one level shallower than caller--
421      **
422      **          This is a RUN... therefore all levels (6) available
423      **          Must be able to return to POLL routine
424      **
425      ** NOTE:
426      **          See Special memory/pointer considerations
427      **          What registers/RAM may be used if handled?:
428      **          --A-D, DO, D1, P always available--
429      **          --R0-R4, scratch RAM?--
430      **
431      **          What registers/RAM may be used if not handled?:
432      **          --A-D, DO, D1, P always available
433      **          --R0-R4, scratch RAM?--
434      **
435      **          What registers/RAM may be used if error exit (POLL only)?:
436      **          No error exit allowed
437      **
438      **          Special memory/pointer considerations (are pointers funny?):
439      **
440      **          Binary Files will always be RUN/CONT from the start of

```

```

441      **   the file... it is "impossible" to systematically
442      **   return a meaningful CONTinue address through the BASIC
443      **   loop. If a Binary file wishes to implement CONT...
444      **   it should respond to the pBSCex poll:
445      **       If current filetype is Binary and sERROR=1
446      **       Update CNTADR @ Binary code to CONTinue at
447      **       Set the SUSP annunciator (SFLAGs)
448      **
449      ** If a Poll Handler intends to CALL BASIC from within:
450      **   Return Address to Poll must be saved on the GOSUB stack
451      **   (Use PSHUPD and POPUPD)
452      **   The FORSTK must be adjust OVER the Poll Save information
453      **   before the CALL and readjust after. CALL uses the
454      **   FORSTK pointer to save information and if FORSTK is
455      **   not adjusted, Poll Information is overwritten
456      **
457      **       Before CALL                      After CALL
458      **
459      **       D1=(5) =FORSTK                      "
460      **       A=DAT1  A                      "
461      **       C=0    A                      "
462      **       LC(2)  =1POLSV                      "
463      **       A=A-C  A                      A=A+C  A
464      **       DAT1=A  A                      DAT1=A  A
465      **
466      ** Envisioned application(s):
467      **   Set up I/O buffers before Binary execution or some
468      **   type of non-BASIC file.
469      **
470      ** History:
471      **
472      **       Date      Programmer      Modification
473      **       -----      -
474      **       09/16/82   JP             Added Poll

1826      **
1827      **      Meaning of "Handling" Poll (what does code do if handled?):
1828      **      Take over BASIC interpreting
1829      **      Set up information/buffers/flags before execution
1830      **      begins, then let Poll continue
1831      **
1832      **      Entry conditions for handler (registers, ST, RAM, etc.):
1833      **      --Carry set on entry iff fastpoll--
1834      **      B[A] = Poll number (pBSCen)
1835      **      HEX mode.
1836      **      P=0.
1837      **
1838      **      If PgmRun (S13)
1839      **      Program about to be executed (RUN/CONT/SST)
1840      **      If NoCont (S14)
1841      **      SST (Single stepping)
1842      **      If sCONT (S10)
1843      **      Continue
1844      **      If sCONTK (S9)
1845      **      CONT or RUN Key
1846      **      RO @ EOL or "@" prior to statement to execute
1847      **      else
1848      **      Keyboard execution from Statement Buffer
1849      **      RO @ Statement length byte of statement
1850      **
1851      **      Normal exit conditions from handler if handled (ST, RAM,
1852      **      registers, etc.):
1853      **      HEX mode.
1854      **      This poll should never be "normally" handled
1855      **      Either the LEX file takes over or allows other
1856      **      LEX files to respond.
1857      **
1858      **      Normal exit conditions from handler if not handled (ST, RAM,
1859      **      registers, etc.):
1860      **      HEX mode.
1861      **      XM=1.
1862      **      Global status intact
1863      **      Do not use S3
1864      **      RO must be PRESERVED !!!!!
1865      **
1866      **      Available subroutine levels:
1867      **      --FPOLL handler is two levels deeper than caller--
1868      **      This is a "top level" poll --- 6 levels available--
1869      **      Must be able to return to Poll routine
1870      **
1871      **      NOTE:
1872      **      GOSUB, CALL, FNx invoked from the keyboard will appear
1873      **      as Keyboard Execute. The PgmRun flag will be clear.
1874      **
1875      **      Program execution will begin with NO indication.
1876      **
1877      **      For CALL: pCALSV polls when CALL execute begins
1878      **      FNx: pFNIN polls when FNx executes begins

```

```

1879      **
1880      ** Binary Files will always be RUN/CONT from the start of
1881      ** the file... it is "impossible" to systematically
1882      ** return a meaningful CONTINUE address through the BASIC
1883      ** loop. If a Binary file wishes to implement CONT...
1884      ** it should respond to the pBSCex poll:
1885      **     If current filetype is Binary and PgmRun=1
1886      **     Update CNTADR to Binary code to CONTINUE at
1887      **     Set the SUSP annunciator (SFLAGs)
1888      **
1889      **
1890      ** What registers/RAM may be used if not handled?:
1891      **     --A-C, D[15-5] D0, D1, P always available (FPOLL only)--
1892      **     --NOTE: D[A] is sacred in FPOLL!--
1893      **     --R1-R4, ST (low 12), scratch RAM--
1894      **     This is a top level poll ... nothing else is going on
1895      **
1896      ** Envisioned application(s):
1897      **     Implement BREAKPOINT capability within program:
1898      **     Set sExcept at entering to allow checking after
1899      **     each statement
1900      **
1901      **     Indicator to FORTH/VISICALC type applications that
1902      **     BASIC has been invoked.

2619      **          goto END30
2620      **
2621      ** Note:
2622      **
2623      ** The sENDx flag was originally used to distinguished END from
2624      ** all other statements/conditions that stop the BASIC loop exec.
2625      ** If a program had been running,
2626      ** this flag allowed CURRL to be updated to the END statement,
2627      ** but prevented the SUSP annunciator from lighting and the
2628      ** CONTINUE address from being updated.
2629      **
2630      ** This sSST flag was used to avoid any checking of a program
2631      ** running by returning to a different place in the BASIC loop,
2632      ** since CURRL could not be updated in situations like SST past
2633      ** the program end.
2634      **
2635      ** When the decision was made to update CURRL only when
2636      ** SUSPENDING the use of two flags is not that different.
2637      ** A "normal" END statement returns through NXTSTM to the BASIC
2638      ** loop. This causes exceptions to be checked before execution is
2639      ** stopped if a program was running. If from the keyboard,
2640      ** execution continues. If sSST is set (from SST past
2641      ** the end of the program or for TRANSFORMing the current file...
2642      ** then the BASIC loop is reentered below the exception checking.
2643      **
2644      ** In either case, neither CNTADR is updated, nor SUSP lit.
2645      **
2646      ** History:
2647      **

4785      ** *****
4786      ** *****
4787      ** *****
4788      ** *****
4789      **
4790      ** Name:(S) pZERPG - Poll to zero program information
4791      **
4792      ** Category:  POLL
4793      **
4794      ** Type:      FPOLL
4795      **
4796      ** Purpose:
4797      **       Fast poll to allow future statements to zero addresses
4798      **       and RAM associated with extending a statement, adding
4799      **       ■ statement or application.
4800      **
4801      **       This poll issued when zero program information due to
4802      **       an END, ENDALL, EDIT, Program Edit....
4803      **
4804      **       Issued from CLRSTK/CLPSTK/ZERPGM routine.
4805      **
4806      ** Should poll be "Handled" (return with XM=0)?:
4807      **       No - This poll should continue to ALL Lex files
4808      **
4809      ** Meaning of "Handling" Poll (what does code do if handled?):
4810      **       Zero appropriate RAM / addresses associated with
4811      **       statement or application.

```

```

4812      **
4813      ** Entry conditions for handler:
4814      **      Carry set on entry
4815      **      B[A] = Poll number (pZERPG)
4816      **      HEX mode.
4817      **      P=0.
4818      **
4819      **      BASIC stacks have been collapsed to appropriate
4820      **      level.
4821      **      CONT, ON ERROR, ON ERROR GOSUB, ON INTR, ON TIMER
4822      **      statement addresses have been zeroed
4823      **      Timer alarm RAM has be zeroed
4824      **      SUSP annunciator/flag has be cleared
4825      **
4826      ** Normal exit conditions from handler if handled (ST, RAM,
4827      ** registers, etc.):
4828      **      This poll should never be "handled".
4829      **      Always return with XM=1
4830      **
4831      ** Normal exit conditions from handler if not handled (ST, RAM,
4832      ** registers, etc.):
4833      **      HEX mode.
4834      **      XM=1.
4835      **      R registers intact. Status intact
4836      **
4837      ** Available subroutine levels:
4838      **      --FPOLL handler is two levels deeper than caller--
4839      **      The invoking routine (CLRSTK/CLPSTK/ZERPGM) uses 3 lvls
4840      **      Therefore, a handler may use ONLY 1 lvl.
4841      **
4842      **      Use RSTK<R to save 3 levels in RSTKBF circular buffer
4843      **      Use R<RSTK to restore 3 levels
4844      **
4845      ** What registers/RAM may be used if not handled?:
4846      **      --A-C, D[15-5] D0, D1, P always available (FPOLL only)--
4847      **      --NOTE: D[A] is sacred in FPOLL!--
4848      **      Do not use an R registers, please !!!!
4849      **      Do not use Status
4850      **      Do not use S-R0-0
4851      **
4852      ** Envisioned application(s):
4853      **      Extend or add a statement (like ON INTP) and need
4854      **      to zero the RAM address associated with the statement.
4855      **
4856      **      Zero I/O Buffer associated with an application because
4857      **      all other program information is being zeroed.
4858      **
4859      ** Note:

927      ****
928      ****
929      ****
930      ****
931      **
932      ** Name:(S) pTMR# - Poll Timer# > 3 for ON/OFF TIMER
933      **
934      ** Category:  POLL
935      **
936      ** Type:      POLL
937      **
938      ** Purpose:
939      **      Poll on Timer# > 3 for ON TIMER and OFF TIMER statements
940      **      Allows Lex File to extend these statements to more than
941      **      3 timers
942      **
943      ** Should poll be "Handled" (return with XM=0)?:
944      **      No - If this poll is handled
945      **      Return is through NXTSTM to continue
946      **      statement/program execution.
947      **
948      ** Meaning of "Handling" Poll (what does code do if handled?):
949      **      For ON TIMER:  Set up the bookkeeping
950      **      Activate the appropriate timer
951      **      For OFF TIMER: Deactivate the appropriate timer
952      **
953      ** Entry conditions for handler
954      **      B[A] = Poll number (pTMR#)
955      **      HEX mode.
956      **      P=0.
957      **
958      **      A(A)  = Timer# > 3 in HEX
959      **      DO    @ past Timer# expression
960      **      If ON TIMER: DO @ tCOMMA
961      **      Comma before timer interval
962      **      If OFF TIMER: DO @ Remark or tEOL or t@
963      **
964      **      PCADDR @ Statement length byte for statement
965      **      (PCADDR) + 2 @ tON or tOFF
966      **
967      ** Normal exit conditions from handler if handled (ST, RAM,
968      ** registers, etc.):
969      **      Return through NXTSTM to continue statement execution
970      **      HEX mode.
971      **      NOTE:
972      **      If binary code invokes BASIC through CALL:
973      **      PCADDR must be saved on the GOSUB stack before CALL
974      **      Call PSHUPD
975      **      and restored before NXTSTM is jumped to
976      **      Call POPUPD
977      **
978      ** Normal exit conditions from handler if not handled:
979      **

```

```

980      **      Carry clear
981      **      HEX mode.
982      **      XM=1.
983      **
984      **      Error exit conditions from handler:
985      **      There is no error return from this poll
986      **
987      **      Available subroutine levels:
988      **      --POLL handler is one level shallower than caller--
989      **      6 levels available
990      **
991      **      What registers/RAM may be used if handled?:
992      **      --A-D, DO, D1, P always available--
993      **      This is a Statement Execute
994      **      All RAM and registers allowed during Statement Execute
995      **
996      **      What registers/RAM may be used if not handled?:
997      **      --A-D, DO, D1, P always available
998      **
999      **      What registers/RAM may be used if error exit:
1000     **      No error return allowed
1001     **
1002     **      Special considerations :
1003     **
1004     **      Tokenized form of statements:
1005     **      ON TIMER:
1006     **      Stmt Length, tON, Timer expression, tCOMMA,
1007     **      Interval expression, tGOTO or tGOSUB, statement ident.
1008     **
1009     **      OFF TIMER:
1010     **      Stmt Length, tOFF, Timer expression
1011     **
1012     **      To service a Timer when it goes off:
1013     **      Respond to pSREQ poll to set sExcept
1014     **      to indicate an Exception has occurred
1015     **      Respond to pExcept to actually service the timer
1016     **
1017     **      To execute Timer branch:
1018     **      Use GOTO+ entry point after:
1019     **      Setting sGOSUB (S3) if GOSUB
1020     **      Reactivating Timer if GOTO
1021     **      Setting sEXTGS (S5) to indicate external entry
1022     **      Setting sXWORD (S9) for line# searching
1023     **      Pushing Return Address (from Timer interrupt)
1024     **      on stack
1025     **      Tracing FROM line
1026     **      (see ONTIMR for parallel code)
1027     **
1028     **
1029     **      Envisioned application(s):
1030     **      Extending Timers to an infinite number with a Lex file
1031     **      that allocates an I/O buffer to keep track of pending
1032     **      timers.
1033     **

1839      **      Name:(S) pCOPYx - Poll for COPY to external device
1840      **
1841      **      Category:  POLL
1842      **
1843      **      Type:      POLL
1844      **
1845      **      Purpose:
1846      **          Poll for COPY utility execute
1847      **          External source or destination file specifier found OR
1848      **          Destination device on PORT is of unknown type
1849      **
1850      **      Should poll be "Handled" (return with XM=0)?:
1851      **          Yes - If successful COPY occurs
1852      **

```

```

1853      ** Meaning of "Handling" Poll (what does code do if handled?):
1854      **      COPY source file to destination file on appropriate
1855      **      device
1856      **
1857      ** Entry conditions for handler (registers, ST, RAM, etc.):
1858      **      B[A] = Poll number (pCOPYx)
1859      **      HEX mode.
1860      **      P=0.
1861      **
1862      **      If D(0) = External Device (D(0)>=8)
1863      **          sEXTDV = 1 (S0)
1864      **          sUNDEF = 1 (S1) if both filenames undefined = 0
1865      **          sDEST = 0 (S3)
1866      **          A      = First 8 characters of source filename
1867      **                  Blanked filled
1868      **          RO(0-3)= Last 2 characters of source filename
1869      **                  Blanked filled if none
1870      **          D(A)   = Source device information from RDINFO
1871      **                  D(0) = Device type
1872      **                  D(1-4)= Devices internal coding
1873      **
1874      **                  HPIL used Device 8 --- see NOTE below
1875      **          R2     = Destination device info from RDINFO
1876      **          SAVSTK holds source and destination information
1877      **                  (See Special Memory/Pointer Considerations)
1878      **
1879      **      If D(0) = Unknown device type (1 < D(0) < 7)
1880      **          A      = First 8 characters of destination filename
1881      **                  (blank filled)
1882      **          RO(0-3)= Last two characters of destination filename
1883      **                  (blank filled)
1884      **          D(0)   = Device type
1885      **          D(1)   = Extender#
1886      **          D(2)   = PORT #
1887      **          STMTRO = Start of source file
1888      **          SAVSTK holds source and destination information
1889      **                  (See Special Memory/Pointer Considerations)
1890      **
1891      **      Normal exit conditions from handler if handled (ST, RAM,
1892      **      registers, etc.):
1893      **          Carry clear
1894      **          HEX mode.
1895      **          XM=0.
1896      **          R1 = Start of file just copied if TO MAINFRAME
1897      **          Source file copied to destination file on appropriate
1898      **          device.
1899      **
1900      **      Normal exit conditions from handler if not handled (ST, RAM,
1901      **      registers, etc.):
1902      **          Carry clear
1903      **          HEX mode.
1904      **          XM=1.
1905      **
1906      **      Error exit conditions from handler:
1907      **          Carry set.

```

```

1908      **      HEX mode.
1909      **      C[0-3] = Error number.
1910      **      COPY was not sucessful due to indicated Error Number
1911      **
1912      ** Available subroutine levels: 6
1913      **      POLL handler is one level shallower than caller--
1914      **      COPYu uses 6 levels; The handler must be able to
1915      **      Return to POLL
1916      **
1917      ** NOTE:
1918      **      HPIL uses Device Type=8
1919      **      This device type is set in response to pFSPCx poll
1920      **      when the file specifier is being evaluated
1921      **      Other device handlers must be assigned their special
1922      **      special device type by the Resource Allocation Czar
1923      **      (See HP-71 IMS Volume 1)
1924      **      Respond to pFILXQ for non HPIL device to gain control
1925      **      of the File Specification execute
1926      **
1927      **      Devices on PORTS (ex: EEPROM) should use Device types
1928      **      between 3 and 6. This device type will be encoded in
1929      **      the ID of the module plugged into a PORT.
1930      **      These Device types must be assigned by the Resource
1931      **      Allocation Czar (see HP-71 IMS Volume 1)
1932      **
1933      ** What registers/RAM may be used if handled?:
1934      **      A-D, D0, D1, P
1935      **      R0,R1,R2,S2,S3,S4,S5,S6,S7,S8,S9
1936      **      Dont' use STMTD0 (saved status for CHAIN)
1937      **
1938      ** What registers/RAM may be used if not handled?:
1939      **      A-D, D0, D1, P
1940      **      R1,S4,S5,S6,S7,S8,S9
1941      **      Don't use STMTD0 (saved status for CHAIN)
1942      **
1943      ** What registers/RAM may be used if error exit (POLL only)?:
1944      **      A-D, D0, D1, P
1945      **      R0,R1,R2,S2,S3,S4,S5,S6,S7,S8,S9
1946      **      Don't use STMTD0 (saved status for CHAIN)
1947      **
1948      ** Special memory/pointer considerations (are pointers funny?):
1949      **
1950      **      The SAVSTK area has been moved toward LOW memory due to
1951      **      the issuing of the POLL. Therefore, all offsets into
1952      **      the SAVSTK area must SUBTRACT the 1POLSV (62 decimal)
1953      **      from the SAVSTK pointer to access the file information.
1954      **
1955      **      Saved information:
1956      **      SAVSTK-5 (- 1POLSV) = Source Device information    5 nibs
1957      **      SAVSTK-25(- 1POLSV) = Source filename            20
1958      **      SAVSTK-30(- 1POLSV) = Destination Device info    5
1959      **      SAVSTK-50(- 1POLSV) = Destination filename       20
1960      **
1961      ** Envisioned application(s):
1962      **

```

```

1963      **      Allow COPY TO filename:TAPE
1964      **      Allow COPY TO filename:PORT(1) where EEPROM in PORT(1)
1965      **      Allow COPY TO a special device in a PORT
1966      **      Allow COPY TO an external device NOT HPIL
1967      **
1968      ** History:

36      **
37      **
38      **             2) Initial conditions dictate that the
39      **             loop isn't be executed at all. Program
40      **             memory (or in the case of CALC BASIC,
41      **             the line until tEOL) is scanned,
42      **             searching for a tNEXT with a matching
43      **             index variable.
44      **             If no match is found, eFwONX is given.
45      **
46      ** Calls:      ASNMNT, NxtCK9, POPSH, LINSKP, TRFLCK, TRCFRM,
47      **             TRTO-, INDXSN, TKSCN7, POPSTK, GETST, RSTST, uTST12,
48      **             EOLSCN, TRCVAR, INVRES, DO=PCA, XQBLK?, MEMCKL
49      **
50      ** Uses:       A-D, P, R0, R2, DO, D1, S2, S8
51      **             R1, S9, S-R1-2 - (only if TRACE is on)
52      **             + R1,R3, all of function scratch, S0-S11 - EXPEXC
53      **
54      ** Detail:     FOR stack is searched for an entry with same index.
55      **             If one is found, that entry is deleted from the

```

```

56      **      stack, and the new FOR declaration is pushed on the
57      **      revised top of the FOR-NEXT stack. [AS HANDLED BY
58      **      CAPRICORN & POINTED OUT IN BYTE MAGAZINE (1-81)].
59      **
60      **      When a loop descriptor is initially pushed on the
61      **      FOR-NEXT stack, 52 nibbles are allocated. This is
62      **      because after the 4 nibble index is pushed on the
63      **      stack, the assignment value is pushed. Everything
64      **      else follows, except the return address; it isn't
65      **      pushed until it is certain the loop will be
66      **      executed and the assignment value deleted from the
67      **      stack. At that time, 16 nibbles are released from
68      **      the stack and therefore returned to available
69      **      memory.
70      **

NOT A DIGIT?

DECREMENT COUNTER

CONVERT TO HEXADECIMAL

B(A) contains keycode; A(A)=0

Invalid keynumber?

No => eIVARG

Mod 56 reduction removes f/g shift

Can B be reduced mod 56

No, then okay

Add it to A

(B.E.T.) Loop back

BOTTOM OF EOL KEY (ROW MAJOR)

ADD SHIFT

NOT the bottom of EOL key?

Yes=> convert to top of EOL key

Adjustment from bottom to top

Do adjustment

Return with carry clear

f SHIFT?

g SHIFT?

```

1939                    ** Name:    POPGSB   -   Pop Stack
1940                    ** Name:(S) POPUPD   -   Pop Stack
1941                    **
1942                    ** Category:   GENUTL
1943                    **
1944                    ** Purpose: Deletes stack entry(ies) and adjusts pointers
1945                    **            --pertains to FOR/NEXT, GOSUB, etc.
1946                    **            POPGSB/POPUPD:
1947                    **            Pop return address/update address off GOSUB stack
1948                    **            --Reads Return Address and Return type, then deletes
1949                    **
1950                    ** Entry:
1951                    **    POPGSB: Sets C(A) and A(A) to top entry of GOSUB stack
1952                    **            Reads Return type and Return address into D
1953                    **            Sets P for PTRADJ
1954                    **    POPSTK: C(A) points to start of entry to delete (pop)
1955                    **            A(A) points to end of entry to delete
1956                    **            P set for PTRADJ
1957                    **
1958                    ** Exit:
1959                    **    POPSTK: CARRY CLEAR, P=0.
1960                    **    POPGSB/POPUPD: If Carry set
1961                    **            Stack was empty, P unchanged
1962                    **            Else carry clear, P=0
1963                    **            D(A) = Return address
1964                    **            D(S) = Return type (see RETURN)
1965                    **
1966                    **            If the address on the stack points into a
1967                    **            file and that file is purged before the
1968                    **            address is popped off, the return address
1969                    **            will be ZERO.
1970                    **
1971                    **            This can happen if Expression Execute is
1972                    **            called, and a multi-line user defined
1973                    **            issues a PURGE.
1974                    **
1975                    **            Calling routines may need to check for this.
1976                    **
1977                    **            via PTRAD1
1978                    **
1979                    ** Calls:    MOVED3, RTNSTK
1980                    **
1981                    ** Uses:     A, B(0-5), C, D1, D0
1982                    **            If POPGSB/POPUPD uses D(W)
1983                    **            B(S) must be preserved for POLL
1984                    **
1985                    ** Detail:   Could also be useful to variable elimination
1986                    **            (e.g. DESTROY) or to eliminating SUB environments
1987                    **            Must immediately precede PTRAD1
1988                    **

```

```

1989      **      If the return address on the stack points into a
1990      **      file and that file is purged before the address is
1991      **      is popped off, this address will be ZERO.
1992      **
1993      **      This can happen if Expression Execute is called and
1994      **      a user defined function issues a PURGE.
1995      **      A calling routine may have to check this is EXPEXC
1996      **      can be called in the interim.

2256      **      Error --> System Error      (CORUPT)
2257      **      If ON TIMER GOSUB return      (A(S)=2,3,4)
2258      **      Reactivate Tiner Interval      (RACTMI)
2259      **      go Restore Rtn address and Run      (goto 3)
2260      **      If Return to Keyboard      (A(S)=1)
2261      **      If Statement buffer empty      (KBRTCK)
2262      **      Exit BASIC loop      (EXITRN)
2263      **      else
2264      **      Return to keyboard (goto 4)      (NXTST5)
2265      **
2266      ** History:
2267      **
2268      ** Date      Programmer      Modification
2269      ** -----
2270      ** 03/07/83 J.P.      Deleted NOPRGM call, see KBRTCK
2271      ** 03/18/83 J.P.      Call SFGPGM if return to Program
2272      ** 04/25/83 J.P.      CLRST when exiting: EXITRN
2273      ** 05/17/83 J.P.      Call TRTOR @ RTNX70
2274      ** 05/19/83 J.P.      Set PCADDR @ Rtnaddr 'cus RETURN
2275      **                  from keyboard into Prgm now SUSPs
2276      ** 05/19/83 J.P.      Remove SFGPGM call; since RETURN

```

```

2277      **                               from keyboard will SUSP now, but
2278      **                               must set PgmRun so SUSP happens
2279      ** 05/27/83 J.P.                 Return to keyboard pop & restores
2280      **                               CNTADR off GOSUB stack
2281      ** 09/12/83 J.P.                 Set PCADDR @ Line length of Rtn
2282      **                               address: SR#1040-5
2283      **
2284      ****
2285      ****
2286      ****
2287      ****
2288      **
2289      ** Name:(S) pRTNTp - Poll on Special Return type
2290      **
2291      ** Category:  POLL
2292      **
2293      ** Type:      FPOLL
2294      **
2295      ** Purpose:
2296      **   Poll for Special Return type
2297      **   Allow for future extension of Special Return types on
2298      **   the GOSUB stack.  When the RETURN is encountered,
2299      **   a LEX file may handled to do something before the
2300      **   RETURN (ex: Reactivate a Timer)
2301      **
2302      **   Return types: 9-E are reserved for future implementation
2303      **   The GOTO+ entry point allows the special Return type to
2304      **   be passed on entry in R3(S)
2305      **
2306      ** Should poll be "Handled" (return with XM=0)?:
2307      **   No - if this poll is handled, it is a take over pollxxx
2308      **
2309      ** Meaning of "Handling" Poll (what does code do if handled?):
2310      **   Do the appropriate "special" return processing
2311      **   Pop address of GOSUB stack
2312      **   Perform the RETURN or POP
2313      **
2314      ** Entry conditions for handler (registers, ST, RAM, etc.):
2315      **   --Carry set on entry iff fastpoll--
2316      **   B[A] = Poll number (pRTNTp)
2317      **   HEX mode.
2318      **   P=0.
2319      **   R2(S) = Return type  (Range = 9-E)
2320      **   R2(A) = Return address
2321      **   sRETRN (S0) = 1 if RETURN
2322      **                  = 0 if POP
2323      **   The address is NOT popped off the stack
2324      **
2325      **   DO NOT destroy S0 or R2 while determining if handling
2326      **
2327      ** Normal exit conditions from handler if handled (ST, RAM,
2328      ** registers, etc.):
2329      **   HEX mode.
2330      **   Perform the "special" processing
2331      **   Pop the address off stack  (GOSBVL =POPGSB)

```

```

2332      **      If POP
2333      **      GOVLNG NXTSTM
2334      **      If RETURN
2335      **      If Return to Program (type must indicate this)
2336      **      Set PgmRun
2337      **      Save return address in R2
2338      **      Set DO @ return address
2339      **      If TRACE needed                              (TRFLCK)
2340      **      TRACE TO                                      (TRTO+)
2341      **      Set DO @ Return address                      (R2)
2342      **      go execute "Return stmt"                    (goving RUNRT1)
2343      **      If Return to Keyboard
2344      **      If tracing                                    (TRFLCK)
2345      **      Send CR/LF                                   (CRLFSD)
2346      **      If Keyboard buffer to return to            (KBRTCK)
2347      **      Set DO @ Return address                    (R2)
2348      **      go execute "Return stmt" (goving RUNRT1)
2349      **
2350      **
2351      **      Sample code:
2352      **
2353      **      GOSBVL    =POPGSB                    Pop addr off stack
2354      **      C=D       A
2355      **      R2=A                                  Save Return address
2356      **      ?ST=0     sRETRN                    POP?
2357      **      GOYES     RTN40
2358      **      ?ST=1     sRTNKY                    Return to Keyboard ?
2359      **      GOYES     RTN20
2360      **      ST=1       PgmRun                    Set Pgm Running flag
2361      **      A=R2                                  Return address
2362      **      DO=A
2363      **      GOSBVL    =TRFLCK                    Tracing ?
2364      **      GOC       RTN10                      No
2365      **      GOSBVL    =TRTO+                    TRACE TO
2366      **      RTN10     A=R2
2367      **      DO=A                                  DO @ Return address
2368      **      GOVLNG    =RUNRT1                    Execute Return stmt
2369      **
2370      **      ■ Return to keyboard
2371      **
2372      **      RTN20     GOSBVL    =TRFLCK                    Tracing ?
2373      **      GOC       RTN30
2374      **      GOSBVL    =CRLFSD                    Send CR/LF
2375      **      RTN30     GOSBVL    =KBRTCK                  Keyboard buffer?
2376      **      GOTO       RTN10                    Yes, go execute
2377      **      *
2378      **      * POP
2379      **      *
2380      **      RTN40     GOVLNG    =NXTSTM
2381      **
2382      **
2383      **      Normal exit conditions from handler if not handled (ST, RAM,
2384      **      registers, etc.):
2385      **      HEX mode.
2386      **      XM=1.

```

```

2387      **      sRETRN (S0) and R2 must be be preserved--
2388      **
2389      ** Available subroutine levels: 7
2390      **      --FPOLL handler is two levels deeper than caller--
2391      **      RETURN/POP is statement execute: all levels available
2392      **
2393      ** NOTE:
2394      **      See GOTO+ entry for pushing special return type on
2395      **      GOSUB stack
2396      **      The return type must NOT conflict with other
2397      **      GOSUB/RETURN extended statements
